Subject: **Phase II Environmental Site Assessment**
Former Polyclad Laminates Site
45 Tannery Street, Franklin, NH
NHDES Site # 199902062

Dear Mr. Koulet:

Attached is the Phase II Environmental Site Assessment for the Former Polyclad Laminates Site located at 45 Tannery Street in Franklin, New Hampshire. **Sections 11** and **12** of the attached report present our conclusions and recommendations regarding the Site. Copies of this report have been forwarded to the New Hampshire Department of Environmental Services (NHDES), the United States Environmental Protection Agency (U.S. EPA), and the City of Franklin.

Please do not hesitate to contact me at (207) 828-1272 ext. 20 if you have any questions, comments, or require additional information regarding this investigation.

Very truly,

CREDERE ASSOCIATES, LLC

Jonathan O'Donnell

EXECUTIVE SUMMARY

Credere Associates, LLC (Credere) has conducted a Phase II Environmental Site Assessment (ESA) at the former Polyclad Laminates Site (the Site) located at 45 Tannery Street in Franklin, New Hampshire, in general conformance with the American Society for Testing Materials (ASTM) Standard Guide for Environmental Site Assessments: *Phase II Environmental Site Assessment Process* E 1903-97 (reapproved 2002). Phase II ESA activities were performed specifically to confirm or dismiss *recognized environmental conditions* (RECs) and other ASTM *non-scope considerations* (NCs) identified during a Phase I ESA that was completed for the Site by Nobis Engineering, Inc. (Nobis) in April 2011 and additional environmental concerns identified by Credere during the development of a site-specific quality assurance project plan (SSQAPP) addendum for the Site.

Credere's Phase II ESA work, which is outlined in the New Hampshire Department of Environmental Services (NHDES) and the United States Environmental Protection Agency (U.S. EPA) approved SSQAPP addendum, included the following: a ground penetrating radar (GPR) survey of the Site to identify subsurface features; advancement of five (5) soil borings; excavation of thirteen (13) test pits; installation of three (3) monitoring wells; and collection and laboratory analysis of two (2) sub-slab soil gas samples, four (4) surficial soil samples, eighteen (18) subsurface soil samples, seven (7) building material/debris samples, and groundwater samples from an existing monitoring well and the three (3) newly installed monitoring wells.

Based on the findings of this work, Credere's conclusions regarding the identified RECs and additional environmental concerns are as follows:

Recognized Environmental Conditions

- REC-1, which was associated the presence of a 12,000-gallon fuel oil underground storage tank (UST) (identified as UST-6) that was closed-in-place in the vicinity of the loading dock, is dismissed because no evidence of contamination was identified in soil samples collected from the sides and adjacent to the bottom of the closed-in-place UST in test pits CA-TP-7 and CA-TP-7A. In addition, observations made by Credere indicated that this UST was filled with clean sand at the time of closure-in-place.
- REC-2, which was associated with the potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-8) shown on a historical Sanborn Map, is dismissed because no UST was identified in this location during the GPR survey and no evidence of contamination exceeding applicable standards was identified in test pits CA-TP-8, CA-TP-10, or CA-TP-11.
- REC-3, which was associated with the potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-9) shown on a historical Sanborn Map, is dismissed because no UST was identified in this location during the GPR survey, and no evidence of

contamination was identified in test pit CA-TP-9 or in soil gas sample locations CA-SG-1 through CA-SG-5, which were completed to evaluate this REC.

- REC-4, which was associated with a former fuel dispenser and a number of filling caps formerly located in the vicinity of the closed-in-place UST-6, is dismissed because no evidence of contamination exceeding applicable standards was identified is soil samples collected from test pit CA-TP-12, which was advanced in the suspected location a former fuel dispenser.
- REC-5, which was associated with the presence of a sheen of degraded gasoline previously noted in 2008 in existing monitoring well MW-2, is confirmed, because groundwater from a newly installed monitoring well (CA-2) located 30 feet southwest of MW-2 contained 1,2,4-trimethylbenzene at a concentration exceeding the applicable NHDES Ambient Groundwater Quality Standard (AGQS), suggesting that a plume of degraded gasoline is present beneath the Site.
- REC-6, which was associated with a subsurface structure identified during a previous GPR survey east of the former building and believed to be a former concrete septic tank, is dismissed because this structure was determined to be a part of the municipal sewer system and not a septic tank, and therefore does not represent a pathway to the subsurface environment.
- REC-7, which was associated with the presence of buried waste related to the previous usage of the Site as a tannery, is dismissed. While evidence of buried waste was observed in the form of leather hides in test pits CA-TP-9, CA-TP-13, and CA-TP-14, no evidence of contamination at concentrations exceeding applicable standards was observed in association with the buried waste. However, this condition represents a solid waste issue that should be properly managed.
- REC-8, which was associated with pipes that were previously noted emitting unknown solvent odors and elevated total volatile organic readings in the southwestern portion of the building, is dismissed, because no evidence of contamination exceeding applicable standards was identified in soil gas (soil gas sample locations CA-SG-6 through CA-SG-11), soil (boring CA-3), or in groundwater (monitoring well CA-3) samples collected from this area.
- REC-9, which was associated with former press pits located within the manufacturing slab that are stained with petroleum, is dismissed because no evidence of contamination was identified in soil samples collected from adjacent to the bottoms of the press pits (borings CA-4 and CA-5).
- REC-10, which was associated with a pile of demolition debris located on the southwestern portion of the Site, is dismissed because no potential lead-based paint or PCB-containing materials were observed in the pile, and no asbestos was identified in a floor tile sample collected from the pile.

Additional Environmental Concerns

The following additional environmental concerns were identified by Credere during development of the SSQAPP and assessed during this Phase II ESA:

- Potential impact associated with the former use of the Site for railroad activities is confirmed, because benzo[a]pyrene was detected above the applicable NHDES Soil Remediation Standards (SRS) in surficial soil sample CA-SS-3. Benzo[a]pyrene is a polycyclic aromatic hydrocarbon (PAH) which is known to be associated with railroad activities.
- The potential impact of a former electrical transformer located on the west side of the building is dismissed, because no PCBs were identified in soil collected from an electrical pit in this area of the Site. Additionally, two samples of stained concrete collected from this area of the Site contained no PCBs above laboratory practical quantification limits.
- A soil sample collected from test pit CA-TP-15 at 5 to 7 feet below ground surface (bgs) contained the PAHs benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene at concentrations which exceeded their applicable NHDES SRS. No staining was observed in this test pit nor was this sample associated with any observed buried wastes. Additionally, no PAHs were identified in soil in contact with buried waste in test pits CA-TP-13 or CA-TP-14. Although this test pit was not in the location of or downgradient of any identified Site USTs, it is Credere's opinion that this contamination may be associated with a past petroleum release from the former UST-10, which was located approximately 40 feet away or from another unknown on-site source.
- Building material sample results indicate that blue 12-inch square floor tile remnants remaining attached to the concrete building slab are asbestos-containing material (ACM). It is not clear if any of these tiles are present in the demolition pile remaining on-site.

Based on observations and results of this Phase II ESA for the Site, Credere makes the following recommendations:

- Credere recommends that delineation of all buried solid waste at the Site be conducted, including tannery hides, other tannery wastes, and building demolition debris, per NHDES Solid Waste Rules Env-Sw 309 in support of a Pre-1981 landfill registration.
- Subsequent to the delineation of all buried solid waste at the Site, Credere recommends that the Site be registered as a Pre-1981 landfill according to NHDES Solid Waste Rules Env-Sw 309.

- Credere recommends that delineation of the identified PAH contaminated surficial soil in the areas of CA-SS-3 and CA-TP-15 be conducted. Credere recommends that a Remedial Action Plan (RAP) be developed to address the PAH contaminated soil.
- Credere recommends additional investigation to assess the full extent and magnitude of degraded gasoline contamination identified at monitoring well CA-2. This additional assessment should supplement the development of a groundwater flow model of the Site in order to define the nature, extent, and/or potential fate and transport characteristics of the identified impacted media. Credere also recommends that this petroleum contamination issue be referred to the NHDES Petroleum Remediation Program as the observed contamination is likely associated with one of the former USTs at the Site. If accepted into this program, future investigation work will be reimbursed by the program.
- Credere recommends that the identified ACM floor tile remaining on the former building slab be properly handled according to all applicable NHDES Asbestos and Solid Waste Rules prior to the development of the Site.

1. INTRODUCTION

This report presents the results of a Phase II Environmental Site Assessment (ESA) conducted by Credere Associates, LLC (Credere) at the former Polyclad Laminates site (the Site) located at 45 Tannery Street in Franklin, New Hampshire as part of the Lakes Region Planning Commission's (LRPC) Brownfields Assessment Program. **Figure 1** shows the general location of the Site in Franklin.

The Phase II ESA was completed in general conformance with the American Society for Testing Materials (ASTM) Standard Guide for Environmental Site Assessments: *Phase II Environmental Site Assessment Process* E 1903-97 (reapproved 2002).

The field program used during this Phase II ESA was completed in accordance with the U.S. Environmental Protection Agency (EPA)-approved June 28, 2011, Site-Specific Quality Assurance Project Plan (SSQAPP) Addendum. The SSQAPP is an addendum to the previously approved New Hampshire Generic QAPP RFA #08166 and #09036, which was prepared for all of Credere's EPA work in New Hampshire. The SSQAPP addendum is included in **Appendix A**. Photographs taken during the completion of this Phase II ESA are included in **Appendix B**.

2. PROJECT BACKGROUND

2.1 SITE DESCRIPTION

The Site is composed of a single vacant 1.97-acre parcel of land located at 45 Tannery Street in Franklin, New Hampshire, that is situated along the Pemigewasset River. The Site consists of a vacant lot with a concrete slab-on-grade foundation and a pile of debris remaining from the previous demolition of the Site building. **Figure 2** shows the former Site building footprint and other pertinent Site features.

According to Nobis Engineering, Inc. (Nobis)'s April 11, 2011, Phase I ESA report for the Site, which was reviewed as a part of the development of the SSQAPP, the Site was first developed in 1892. By approximately 1930, the first building was constructed on the Site. The most recent building was demolished in 2008 after it collapsed due to heavy winter snow cover.

According to the Nobis Phase I ESA report, the Site appears to have been used for railroad purposes when the Boston & Maine and Bristol Railroad transected the Site beginning in 1892. It is not clear when railroad activities ceased on the Site. However, records do show that the Hingston Leather Company, Inc. and Louis Verza Leather Company were using the Site for tannery activities beginning in the 1950s until the mid to late 1950s. Nobis indicated that there was very little environmental information available for the Site as it pertains to the former tannery operations.

Between 1979 and 1980, Polyclad Laminates, Inc. began operations on the Site. Polyclad Laminates, Inc. manufactured component materials used in multi-layered circuit boards called "pre-preg." The process involved dipping fiberglass cloth in a dip tank filled with epoxy resin. Polyclad Laminates used the Site for the manufacture of pre-preg from between 1979 and 1980 until approximately 2006.

2.2 SUMMARY OF PREVIOUS WORK

The following is a summary of the findings and conclusions of Nobis as reported in their April 2011 Phase I ESA for the Site:

2.2.1 Recognized Environmental Conditions

1. The presence of a 12,000-gallon fuel oil underground storage tank (UST) (identified as UST-6) that is located in the vicinity of the loading dock and was closed-in-place (date uncertain) represented a REC.

2. The potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-8) shown on a Sanborn Map represented a REC because the presence of this tank has not

been confirmed and no documentation regarding closure of the tank or information on the integrity of the tank was identified during the Phase I ESA.

3. The potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-9) shown on a Sanborn Map represented a REC because the presence of this tank has not been confirmed and documentation regarding closure of the tank or information on the integrity of the tank was not identified during the Phase I ESA.

4. Due to the potential for undocumented past releases to the environment, Nobis identified a REC associated with presence of a former gasoline dispenser and a number of filling caps formerly located in the vicinity of former UST-6 because these items may have been associated with additional undocumented USTs in this area, and documentation regarding the removal of this dispenser or the disposition of related piping with respect to potential releases has not been confirmed.

5. The presence of a sheen of degraded gasoline previously noted in 2008 in monitoring well MW-2 for which a source was not identified, represents a REC due to the potential for an unidentified source of petroleum contamination to be present at the Site. [Note: According to a Phase II ESA Report prepared by Delta Consultants on April 10, 2008, previous sampling data collected in 2007 indicates that no volatile organic compounds (VOCs), metals, or polychlorinated biphenyls (PCBs) were detected in excess of New Hampshire Soil Remediation Standards (SRS) in a soil sample collected at 30 to 32 feet bgs during drilling of this well and no VOCs or semi-volatile organic compounds (SVOCs) were detected in excess of Ambient Groundwater Quality Standards (AGQS) in the groundwater sample collected from this well. However, a petroleum sheen was noted during sampling of the groundwater and the tentatively identified compounds (TICs) noted during laboratory analysis revealed that the sheen was likely gasoline.]

6. The potential that a subsurface structure identified during a ground penetrating radar (GPR) survey east of the former building, which was suspected to be a former concrete septic tank, represents a REC because of the potential for previous undocumented subsurface storage or disposal of hazardous substances and/or petroleum products in and around this structure.

7. The presence of buried waste related to the previous usage of the Site as a tannery represents a REC because the understanding of the extent and disposition of the waste (leather waste or unsuitable materials) is limited and may have led to improper disposal of hazardous substances.

8. Nobis concluded that, because of the potential for undocumented releases of hazardous substances in the past or in the future, pipes that were previously noted emitting unknown solvent odors and elevated total volatile organic compounds detected in the former chemical mixing room in the southwestern portion of the building, represented a REC

because the source of these odors (which may be a formerly closed-in-place acetone tank) is not known.

9. Two former press pits located within the manufacturing slab that are stained with petroleum represent a REC and they have not been fully assessed.

10. A pile of unknown debris located on the southwestern portion of the Site that is consistent with demolition debris represents a REC for its potential to contain waste ACM, lead-based paint [and other contaminants].

2.2.2 Other Potential Environmental Conditions

Based on review of the April 2011 Nobis Phase I ESA, Credere offers the following list of other potential environmental conditions:

1. Nobis documented that the Site was previously used for railroad activities beginning as early as 1892. Nobis concluded that this past use of the Site represented a *de minimis condition* because any contaminants from this past use would likely be deemed a background condition. Credere agrees with this assertion, but it is our opinion that non-point source background type releases of polycyclic aromatic hydrocarbons (PAHs), which would be considered the primary contaminants of concern, still represent a threat to human health if they exceed applicable New Hampshire Department of Environmental Services (NHDES) soil standards and should be addressed as a part of future redevelopment of the Site. Therefore, it is our opinion that this past use should be assessed as a part of this Phase II ESA.

2. Nobis indicated in the Phase I ESA that a data gap in the form of snow cover was noted during the Site Reconnaissance portion of their work. Given that the ground could not be observed, confirmation of exterior surface conditions is warranted prior commencing Phase II ESA field work because additional RECs may be identified that require assessment. As a result, a supplemental Site Reconnaissance is recommended as the first task of this Phase II ESA.

3. A former electrical transformer was located on the west side of the building. No information was noted in the previous reports regarding the potential presence of PCBs in the dielectric fluid associated with this transformer. However, considering the timeframe when this transformer would have been in operation, it may have contained PCBs, and a potential release of dielectric fluid from this former transformer may have impacted environmental conditions at the Site. For this reason, the potential presence of PCBs is a concern that should be considered.

2.2.3 History of Underground Storage Tanks at the Site

The operational history of USTs is an important element in the environmental history of the Site. As result, the information below, as reported by Nobis in the April 2011 Phase I ESA, provides an inventory of the USTs which have been identified at the Site. Additional details concerning UST history can be reviewed in the previously submitted Nobis Phase I ESA.

UST ID	Capacity (gallons)	Material Held	Current Status
UST -1	6,000	Methyl Cellosolve	Removed, 1998
UST-2	4,500	CS 350 Acetone	Closed in-place, 1998
UST-3	4,500	Epoxy Resin	Closed in-place, 1999
UST-4	6,000	CS 350 Acetone	Closed in-place, 1999
UST-5	4,000	Gasoline	Removed, date uncertain.
UST-6	12,000	Fuel Oil	Closed in-place, date uncertain
UST-7	13,500	Epoxy Resin	Removed 2008
UST-8	4,000	Fuel Oil	Status unknown, approximate location from 1964 Sanborn Map
UST -9	4,000	Fuel Oil	Status unknown, approximate location from 1929 Sanborn Map
UST-10	8,000	Waste Petroleum Distillates	Removed 2008

2.2.4 Other Documented Previous Environmental Work Cited by Nobis

The Nobis Phase I ESA details the completion of several other investigations, which were completed outside the Brownfields due diligence process, likely as part of a previous effort to sell the Site. Documented previous works include the following:

1. A January 12, 1999 Underground Storage Tank (UST) Closure Report UST-1 prepared by Les A. Cartier and Associates, Inc.
2. A July 15, 1999 UST Closure Report UST-2, UST-3 and UST-4 prepared by Environmental Science & Engineering (ESE).
3. A 2005 Phase I Environmental Site Assessment and Limited Compliance Review prepared by Delta Consultants.
4. An April 10, 2008 Phase II Environmental Site Assessment prepared by Delta Consultants.
5. An October 15, 2008 UST Closure Report UST-7 and UST-10 prepared Delta Consultants.

The conditions identified by Nobis in **Section 2.2** cumulatively considered all the above referenced previous investigations. Credere also reviewed and considered this cumulative work as a part of the development of the SSQAPP for the Site.

2.3 POTENTIAL FUTURE SITE USE

The City of Franklin has partnered with LRPC to assess the Site so that the City can redevelop the Site into a new Water Department Building.

3. PHASE II SCOPE OF WORK

Credere performed this Phase II ESA to assess the Site considering the anticipated re-use scenario and the identified environmental conditions noted in **Section 2**. An SSQAPP Addendum was developed that outlined the work to be completed, methodologies to be used, and data quality objectives for the project (see **Appendix A**). The Phase II ESA tasks completed included the following:

1. Ground Penetrating Radar (GPR) survey of the Site to identify subsurface features
2. Four (4) surficial soil samples were collected to and submitted for off-site laboratory analysis.
3. Thirteen (13) test pits were excavated at the Site and subsurface soil samples from twelve (12) test pits were collected and submitted for off-site laboratory analysis.
4. Five (5) soil borings were advanced at the Site and subsurface soil samples were collected and submitted for off-site laboratory analysis.
5. Three of the soil borings were completed as monitoring wells (CA-1, CA-2, and CA-3), and groundwater was collected from the new monitoring wells and existing monitoring well MW-2, and submitted for off-site laboratory analysis.
6. Building material/debris samples were collected from the former building foundation slab and from a demolition debris pile at the Site and submitted for off-site laboratory analysis.

Deviations from the scope of work described in the SSQAPP Addendum are summarized in **Section 9** of this report.

4. PHASE II FIELD ACTIVITIES

This sampling program was developed to confirm or dismiss the RECs identified during the Phase I ESA (see SSQAPP Addendum in **Appendix A**) and other potential environmental conditions identified by Credere. All soil, groundwater, and potential PCB-containing building material samples collected by Credere for laboratory analysis were submitted to Absolute Resource Associates of Portsmouth, New Hampshire for analysis. Soil gas samples collected by Credere for laboratory analysis were submitted to Alpha Analytical of Mansfield, Massachusetts. Potential asbestos-containing building materials were submitted to EMSL Analytical, Inc. of Woburn, Massachusetts. Requirements relative to Chain of Custody, Data Management and Documentation, Data Validation, and Data Usability Assessments contained in the SSQAPP were followed. **Figure 2** shows the approximate locations of the building, pertinent Site features, and sample locations.

4.1 GROUND PENETRATING RADAR SURVEY

On June 28, 2011, Credere oversaw a GPR survey of the Site by DigSmart of Maine (DigSmart) to identify subsurface features at the Site potentially associated with environmental conditions at the Site. DigSmart scanned the subsurface with a GPR by walking in continuous and consecutive north-south transects over the areas of the Site associated with RECs (see **Appendix A**). The GPR technician located the lateral extent of subsurface anomalies in areas of concern at the Site. The location of subsurface anomalies was marked on the surface in pink spray paint.

4.2 SURFICIAL SOIL INVESTIGATION

On June 28 and July 5, 2011, Credere collected three (3) surficial soil samples (CA-SS-1, CA-SS-2, and CA-SS-3) to assess possible impacts to the surface from former railroad activities at the Site. The locations of these samples at the Site are depicted on **Figure 2**. The collected samples were submitted for off-site laboratory analysis of PAHs.

All surficial soil samples were collected from 0 to 2 feet below ground surface (bgs) in accordance with standard operating procedures (SOPs) HWRB-11, HWRB-12, HWRB-15, DR#024, DR#025, and Credere-004. Any visible organic debris and/or grass or degraded asphalt was removed from samples prior to placement in laboratory glassware.

Each collected soil sample was logged and visual and/or olfactory evidence of contamination was noted. Samples were then field screened for VOCs with a 10.6 electron volt (eV) photoionization detector (PID) calibrated to a 100 parts per million by volume (ppm_v) isobutylene standard with the instrument response factor set to 1.0. Surficial soil samples were also screened for RCRA 8 metals with an Innov-X X-ray fluorescence (XRF) meter.

Exploration locations and methodologies used are summarized in **Table 1**, PID field screening results are included in **Table 2,** and XRF field screening results are included in **Table 3**.

4.3 TEST PIT INVESTIGATION

On June 28, 2011, Credere oversaw test pit investigation activities which were performed by J.A. Eaton Inspection Services, Inc. of Windham, Maine to assess RECs identified in the previous Phase I ESA and to investigate subsurface anomalies identified during the GPR survey. Please note that six (6) test pits were previously excavated part of a 2008 investigation by Delta Consultants (TP-1 to TP-6). Test pits TP-1 and TP -2 were located off of the Site in the adjacent parking area to the south of the Site. Test pits TP-3 to TP-6 were located on the Site, and are depicted on **Figure 2**. Thirteen (13) test pits were excavated by Credere during this Phase II ESA work, and are identified as CA-TP-7, CA-TP-7A, and CA-TP-8 through CA-TP-18. Soil samples were continuously collected from each test pit. Each collected soil sample was logged and visual and/or olfactory screened for evidence of contamination and was then screened for VOCs with PID and for metals using an XRF as described in **Section 4.2**.

The rational for each test pit and soil samples submitted for laboratory analysis are provided below. The locations of each test pit are described in **Table 1** and are also depicted on **Figure 2**. Copies of test pit logs are included as **Appendix C.**

CA-TP-7
Test pit CA-TP-7 was excavated along the western side of a closed-in-place UST, believed to be UST-6, which is a 12,000-gallon former fuel oil UST. The top of the UST was located at 4 feet bgs. A ductile iron pipe was located parallel to the UST at 8 feet bgs, which prevented the advancement of the test pit past this depth. No soil sample was submitted for laboratory analysis from this test pit, and a second test pit was excavated to assess soil near the bottom of the UST.

CA-TP-7A
Test pit CA-TP-7A was advanced along the southern side of the closed-in-place UST believed to be UST-6, which is a 12,000-gallon former fuel-oil UST. The top of the UST was located at 4 feet bgs and the bottom of the UST was located at approximately 11 feet bgs. Samples from deeper than 12 feet bgs were collected using a split-spoon sampler driven from a drill rig because this depth was beyond the capacity of the excavator used at the Site (see **Section 4.5**). The 10 to 12 foot bgs soil sample was submitted for laboratory analysis of NHDES *Petroleum and Hazardous Waste Full List of Analytes for Volatile Organics* (NHDES Full List VOCs), total petroleum hydrocarbons (TPH), lead, and PAHs because this sample was just below and adjacent to the bottom of UST-6.

CA-TP-8
Test pit CA-TP-8 was excavated west of the former building in the area where a reported 4,000-gallon fuel oil UST (identified as UST-8) was shown on a historical Sanborn Map. No evidence of a UST was identified in this test pit. No evidence of contamination was observed in this test pit, although the upper 4.5 feet of material was comprised of

building demolition debris, consisting of mostly crushed concrete block, and an older asphalt paving layer was encountered at 4.5 feet bgs. The material beneath the asphalt layer was composed of sand with some gravel. The 6 to 8 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, TPH, and PAHs because this was perceived to be the intersection of fill materials and native material.

CA-TP-9

Test pit CA-TP-9 was excavated beneath the northern end of the building slab where a reported 4,000-gallon fuel oil UST (identified as UST-9) is shown on a historical Sanborn Map. No evidence of a UST was identified during the GPR survey or in this test pit. The test pit location was between a patch in the concrete slab and an area of GPR anomalies beneath the slab. Tannery waste in the form of hides was observed from 2 to 4 feet bgs. Asphalt pieces were encountered at approximately 8 feet bgs. The 6 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, TPH, and PAHs because this was immediately beneath the buried tannery waste.

CA-TP-10

Test pit CA-TP-10 was excavated west of the former building in the area where a reported 4,000-gallon fuel oil UST (identified as UST-8) was shown on a historical Sanborn Map. No evidence of a UST was identified in this test pit. No evidence of contamination was observed in this test pit, although the upper 4.5 feet of material was comprised of building demolition debris, consisting of mostly crushed concrete block. An older asphalt paving layer was present at 4.5 feet bgs. The material beneath the asphalt layer was composed of sand with some gravel. The 0 to 2 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs and total Pb because of elevated metals detected during XRF field screening.

CA-TP-11

Test pit CA-TP-11 was excavated west of the former building in the area where a reported 4,000-gallon fuel oil UST (identified as UST-8) was shown on a historical Sanborn Map. No evidence of a UST was identified in this test pit. No evidence of contamination was observed in this test pit, although the upper 3 feet of material was comprised of building demolition debris, consisting of mostly crushed concrete block, and an older asphalt paving layer was present at 3 feet bgs. The 6.5 to 9 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs and total Pb because of elevated metals detected during XRF field screening.

CA-TP-12

Test pit CA-TP-12 was advanced west of the former building in the suspected location of a former fuel dispenser. A concrete sump extended to 2 feet bgs. A soil sample collected from 3 foot bgs was submitted for laboratory analysis of NHDES Full List VOCs and total Pb because petroleum staining was observed at this depth.

CA-TP-13
Test pit CA-TP-13 was excavated east of the former building in a location where the GPR survey indicated possible waste fill materials. Tannery waste in the form of hides was observed from 4 to 5 feet bgs. However, the 2 to 4 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, PAHs, and PCBs because this sample was in contact with the buried tannery waste and elevated chromium (Cr) was noted in this sample during XRF field screening.

CA-TP-14
Test pit CA-TP-14 was excavated east of the former building foundation in a location where the GPR survey indicated possible waste fill materials. Tannery waste in the form of hides was observed from 4 to 8 feet bgs. The 6 to 8 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, and PAHs because this sample was in contact with the buried tannery waste and elevated chromium was noted during XRF field screening. This sample was also analyzed for hexavalent Cr (Cr VI) based on the results of total Cr analysis.

CA-TP-15
Test pit CA-TP-15 was excavated east of the former building foundation to assess possible buried tannery waste. No tannery waste was present in this test pit. The 5 to 7 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, and PAHs because of the presence of wastes at this depth in test pit CA-TP-14.

CA-TP-16
Test pit CA-TP-16 was excavated west of the former building foundation to assess possible buried tannery waste. No tannery waste was present in this test pit. However, sand and gravel fill was observed in the 0 to 2 foot bgs interval, and native material was observed below this interval. Therefore, the 0 to 2 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, and PAHs to characterize fill material that did not appear to be associated with tannery waste at the Site.

CA-TP-17
Test pit CA-TP-17 was advanced north of the former building foundation to assess possible buried tannery waste. No tannery waste was present in this test pit. However, the 4 to 7 foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, and PAHs because of the presence of wastes at this depth in test pits CA-TP-13 and CA-TP-14.

CA-TP-18
Test pit CA-TP-18 was excavated north of the former building foundation to assess possible buried tannery waste. No tannery waste was present in this test pit. The 3 to 5

foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, RCRA 8 metals, and PAHs because of the presence of wastes at this depth in test pits CA-TP-13 and CA-TP-14.

4.4 SUB-SLAB SOIL GAS INVESTIGATION

On June 28, 2011, Credere installed eleven (11) soil gas collection points beneath the concrete slab of the former Site building. Five (5) soil gas collection points (CA-SG-1 to CA-SG-5) were installed beneath the northern end of the slab to assess a suspected former UST (REC-3), and six (6) soil gas collection points (CA-SG-6 to CA-SG-11) were installed beneath the southern end of the slab to assess previously observed organic vapor odors (REC-8) in this area.

A 0.5-inch diameter hole was drilled through the slab and underlying sub-base material in each sampling location. A steel soil gas/pore-water probe was then installed in the drilled hole to a depth of 6 inches beneath the slab bottom. The annulus around the sampler was then sealed with activated bentonite clay and the probe was allowed to equilibrate for one hour. At this time, the internal rod was removed from the soil gas/pore-water sampler and the soil gas was field screened with a ppbRAE Plus PID, which is a low level PID capable of measuring VOCs in air below 1 ppm_v. The PID was connected to the sampler using low-density polyethylene (LDPE) tubing and calibrated to a 10 parts per million by volume (ppm_v) isobutylene standard with the instrument response factor set to 1.0.

One location from each area (CA-SG-1 to CA-SG-5 and CA-SG-6 to CA-SG-11) with the highest field screening VOC concentration was then sampled for laboratory analysis for VOCs using a vacuum sealed Summa canister connected to the sampler using LDPE tubing with an elapsed sampling time of one hour. The Summa canisters were then submitted for laboratory analysis of Toxic Organic Compounds in Ambient Air by EPA Method TO-15.

4.5 SOIL BORING AND MONITORING WELL INSTALLATION

Five (5) soil borings (CA-1 through CA-5) were advanced at the Site on June 29, 2011. Soil boring locations are depicted on **Figure 2**. T&K Well Drilling, a licensed NH well driller, from Troy, NH was retained by Credere and performed the drilling activities. Credere was onsite during the work to provide oversight of the drilling and well installation and to collect soil samples for field screening and laboratory analysis.

Soil borings were advanced using a truck-mounted hollow stem auger drill rig. Soil samples were continuously collected and logged using split-spoon soil sampling. Borings CA-4 and CA-5 were advanced to 10 feet bgs before sampling to assess the soils adjacent to the bottom of the former press pits. Each collected soil sample was field logged and then screened for VOCs with a PID and for metals using an XRF as described in **Section 4.2**.

Monitoring wells were installed in soil boring locations CA-1, CA-2, and CA-3. Each monitoring well was completed with two-inch diameter PVC pipe and 0.010-inch wide slotted PVC screen. The annulus was packed with size No. 2 washed sand to approximately 1-foot above the screen depth and a bentonite seal was placed on top of the annulus and at the ground surface to prevent surface water infiltration. Following installation, each monitoring well was developed and allowed to equilibrate for five days prior to sampling. **Table 1** is a summary of the exploration methods used at each location including the media that was sampled. Field screening results are included in **Table 2** and **Table 3**. Copies of soil boring logs are included as **Appendix D.**

The rationale for the location of each soil boring and the soil sample submitted for laboratory analyses is provided below:

CA-1

Soil boring CA-1 was advanced to a depth of 35 feet bgs in the location of soil gas sampling point CA-SG-2, which had the highest VOC concentration observed during field screening of sub-slab soil gas sampling from locations CA-SG-1 to CA-SG-5. These soil gas sampling points were positioned in an area where a former UST (UST-9) was believed to have been located. The 26 to 28-foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs, TPH, and PAHs because the water table was present within this depth interval, and although an aromatic odor was observed throughout the entire boring depth during advancement of the boring, no PID field screening evidence of contamination was observed during drilling at this location.

Soil boring CA-1 was completed as a monitoring well, screened from 25 to 35 feet bgs to intersect the water table.

CA-2

Soil boring CA-2 was advanced to a depth of 35 feet bgs in an area east of the former Site building where buried tannery waste was observed during test pitting and near existing well MW-2 (the location where a sheen was observed on groundwater in 2008). CA-2 was originally planned to be located downgradient of the suspected septic tank, but the boring/well was moved to generally assess the groundwater flow from the rest of the site when it was discovered that the suspect septic tank was actually part of the Franklin sewer system. The 6 to 8-foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs and RCRA 8 metals plus Cu, Ni, and Zn because VOCs and elevated Cr indicative of tannery waste were detected in this interval during field screening.

Soil boring CA-2 was completed as a monitoring well, screened from 25 to 35 feet bgs to intersect the water table.

CA-3

Soil boring CA-3 was advanced to a depth of 35 feet bgs in the location of soil gas sampling point CA-SG-10, which had the highest VOC concentration observed during field screening of sub-slab soil gas sampling from locations CA-SG-6 to CA-SG-11. These soil gas sampling points were positioned in an area where organic odors had previously been observed emanating from a pipe during the Phase I ESA (REC-8). The 2 to 4-foot bgs soil sample was submitted for laboratory analysis of NHDES Full List VOCs and RCRA 8 metals plus Cu, Ni, and Zn. This sample interval was selected because Cr, Pb, and Hg were identified in the sample during XRF field screening at concentrations which may exceed the NHDES SRS.

Soil boring CA-3 was completed as a monitoring well, and was screened from 25 to 35 feet bgs to intersect the water table.

CA-4 and CA-5

Soil borings CA-4 and CA-5 were advanced immediately adjacent to the former press pits located within the former building footprint. One attempt was made to advance CA-5 within one of the former press pits, which are now filled with demolition debris. However, the bottom of the press pit, located at 10 feet bgs, is composed of reinforced concrete and prevented full penetration of the augers (i.e. refusal). The locations of CA-4 and CA-5 were then moved to be immediately adjacent to the press pits on the downgradient (east) side, and borings were advanced to 10 feet bgs before beginning sampling.

CA-4 and CA-5 were advanced to 10 feet bgs, and then samples were collected continuously from 10 to 14 feet bgs. An aromatic odor was observed in both borings that was similar to the odor observed in boring CA-1; however, no evidence of contamination was identified with PID field screening. The 10 to 12 foot bgs soil sample from CA-4 and the 12 to 14 foot bgs soil sample from CA-5 were submitted for laboratory analysis of NHDES Full List VOCs, TPH, RCRA 8 metals plus Cu, Ni, and Zn, SVOCs, and PCBs to assess soil adjacent to the bottom of the press pits.

CA-TP-7A (Soil Boring Portion)

Samples from 10 to 16 feet bgs from test Pit CA-TP-7A were collected using a split-spoon sampler driven from a drill rig because this depth was beyond the capacity of the excavator used at the Site. The 10 to 12 foot bgs soil sample was submitted for laboratory analysis of NHDES *Petroleum and Hazardous Waste Full List of Analytes for Volatile Organics* (NHDES Full List VOCs), total petroleum hydrocarbons (TPH), total lead (Pb), and polycyclic aromatic hydrocarbons (PAHs) because this sample was adjacent to the end of the tank bottom.

4.6 GROUNDWATER SAMPLING

Credere returned to the Site on July 5, 2011, to sample the newly installed monitoring wells and previously installed monitoring well MW-2.

Each of the new monitoring wells was surveyed for location and relative groundwater elevations were measured for the new monitoring wells and existing monitoring well MW-2. Based on the results of the survey and measured groundwater elevations, a model of groundwater flow was interpolated**.**

Depth to groundwater at the Site at the date of sampling was approximately 27 feet bgs, which is at the practical suction limits of Credere's low-flow peristaltic pump. Credere therefore opted to deviate from the EPA-approved SSQAPP and collect groundwater by purging the wells with a submersible pump. Samples were then collected with a single use bailer in accordance with NHDES Standard Operating Procedures (HWRB-2, HWRB-4 and HWRB-6) included in Credere's NHDES/EPA approved generic NH QAPP.

A minimum of three well volumes of groundwater were pumped from each well prior to using the bailer for collecting samples. Field measurements were collected for temperature, pH, conductivity, oxidation-reduction potential, and turbidity at approximate 5-minute intervals.

Because bailers were used to sample the wells, Credere did not have the proper equipment to field filter the samples for metals from CA-2 and CA-3. Credere therefore opted to collect unfiltered samples in the HNO_3-preserved laboratory HDPE bottles. These samples were therefore *total* metals, which was a deviation from the specification for *dissolved* metals that was included in the EPA approved SSQAPP. Results revealed that chromium Cr and Pb were present in the CA-2 sample in excess of their Ambient Groundwater Quality Standards (AGQS). As a result, Credere then returned to the Site on July 14, 2011 and re-sampled well CA-2. The collected sample was filtered in the field through a 0.2 micron filter, and the collected sample was submitted for laboratory analysis of *dissolved* RCRA 8 metals. Groundwater sampling logs are included in **Appendix E**, and groundwater and monitoring well elevation field data are included as **Table 4**.

All collected groundwater samples were submitted to ARA for laboratory analysis. Groundwater sample from location CA-1 was analyzed for NHDES Full List VOCs. The initial sample from location CA-2 was analyzed for NHDES Full List VOCs, SVOCs, and *total* RCRA 8 metals plus Cu, Ni, and Zn. A second sample from CA-2 was analyzed for dissolved RCRA 8 metals. The groundwater sample collected from CA-3 was analyzed for NHDES Full List VOCs and total RCRA 8 metals. The groundwater sample collected from MW-2 was analyzed for NHDES Full List VOCs and total Pb.

4.7 BUILDING MATERIAL DEBRIS SAMPLING

4.7.1 Potential Asbestos Containing Materials

On June 28, 2011, NH-certified Asbestos Inspector Judd Newcomb (Certification # AI 000383) of Credere inventoried suspect asbestos-containing material (ACM) bulk products in building demolition debris and on the former building foundation at the Site. Credere identified four (4) potential ACMs and collected three (3) samples of each material for laboratory analysis for asbestos in accordance with NHDES Env-A 1800. Samples were submitted to EMSL of Woburn, Massachusetts for analysis. Copies of generated laboratory reports are included as **Appendix F**.

The following is a description of the collected potential ACM-containing bulk product samples:

- Potential ACM bulk product sample D-1 was collected from light blue 12 inch-square floor tiles remaining on the former building slab.
- Potential ACM bulk product sample D-2 was collected from white speckled floor tile remaining on the former building slab.
- Potential ACM bulk product sample D-3 was collected from gray floor tile remaining on the former building slab.
- Potential ACM bulk product sample D-4 was collected from off-white floor tile pieces in the debris pile located on the southern end of the former building slab.

4.7.2 Potential PCB-Containing Materials

On June 28, 2011, Credere inventoried suspect PCB-containing bulk products in building demolition debris and on the building foundation at the Site. Examples of suspect products typically include, but are not limited to, paint, caulking, sealants, grout, mastic, glazing, insulation, transformers, capacitors, electrical equipment, used motor/hydraulic oil, fluorescent light ballasts, cable insulation, thermal insulation, adhesives and tapes, plastics, carbonless copy paper, floor finishes, gaskets, ceiling tile coatings, flooring sealants, roofing materials, and siding materials. Consistent with this inventory and the results of previous investigations at similar sites, Credere identified and sampled one (1) potentially PCB-containing bulk product. The collected material was a blue floor coating (sample D-Floor Covering) that was noted coating a portion of the former building foundation. This sample was submitted to ARA for analysis of PCBs.

Additionally, Credere collected a soil sample for an electrical pit (identified as Transformer Pit) and two concrete samples (CA-CC-1 and CA-CC-2) from oil-stained concrete in an area where a transformer may have been located which may have been impacted by possible PCB-containing dielectric fluid released from a former transformer.

5. SUMMARY OF REGULATORY STANDARDS

As a part of this Phase II ESA, Credere collected soil, groundwater, soil gas and building material samples to confirm or dismiss the presence of contaminants associated with the RECs and other potential environmental concerns identified at the Site, and to assess the potential for future risk which may result during anticipated redevelopment. Sample results were compared to the applicable state and federal standards and guidelines described below.

5.1 SOIL

Concentrations in soil samples were compared to New Hampshire's Soil Remediation Standards (SRS) detailed in NHDES Env-Or 600 Contaminated Site Management.

5.2 GROUNDWATER

Concentrations in groundwater samples were compared to New Hampshire's Ambient Groundwater Quality Standards (AGQS) detailed in NHDES Env-Or 600 Contaminated Site Management.

5.3 SOIL GAS

Concentrations of VOCs in sub-slab soil gas were compared to the NHDES Vapor Intrusion Screening Levels for Commercial Soil Gas and the Vapor Intrusion Mitigation Decision Criteria, both updated July 2011. Analytes in soil gas without screening levels were considered to be unregulated.

5.4 POTENTIAL ASBESTOS-CONTAINING MATERIALS

Concentrations of asbestos in building material and debris samples were compared to the limit of 1% by weight detailed in NHDES Env-A 1800 Asbestos Management and Control.

5.5 POTENTIAL PCB-CONTAINING MATERIALS

Bulk products that contain concentrations of total PCBs equal to or in excess of 50 mg/kg are defined as PCB bulk product wastes in accordance with 40 CFR 761.3. These materials are regulated for disposal under 40 CFR 761.62. Bulk products that have been analyzed to contain total PCBs at a concentration of equal to or greater than 1 mg/kg but less than 50 mg/kg (and not as a result of dilution) are not regulated for disposal as long as they remain in use. However, if these materials are removed from use, they must be disposed of at a facility that is licensed to accept these materials in accordance with the applicable state regulations. Bulk products which have been analyzed to contain total PCBs at a concentration of less than 1 mg/kg are unrestricted for future use and/or disposal.

Bulk materials which have been analyzed to contain total PCB concentrations equal to or in excess of 1 mg/kg as a result of contact with a PCB bulk product waste are defined as a PCB remediation waste in accordance with 40 CFR 761.3. These materials must be disposed of in accordance with 40 CFR 761.61 or under a special approval which meets the requirements presented at 40 CFR 761.79(h). Bulk materials which have been analyzed to contain total PCBs at concentrations of less than 1 mg/kg are unrestricted for future use and/or disposal.

6. PHASE II RESULTS

The following subsections present the results of the data collected during the field work portion of this Phase II ESA.

6.1 SITE GEOLOGY

6.1.1 Surficial Geology

During the advancement of soil borings for the current and previous Phase II ESA work, the native surficial geology of the Site was observed to consist of sand deposits with some gravel. Areas of the northern and eastern portions of the Site were observed to contain up to 8 feet or more of fill material, some of which included thin layers of tannery waste in the form of scrap hides (see **Figure 7**).

6.1.2 Bedrock Geology

No bedrock was encountered at the Site during test pit or soil boring activities. According to the Generalized Bedrock Geologic Map of New Hampshire compiled by the United States Geological Survey, the Site is underlain primarily by aluminous schist, calc-silicate granofels, and bimodal metavolcanic rocks of Silurian age.

6.1.3 Site Hydrogeology

Groundwater elevations are based on water levels recorded on July 5, 2011, and are depicted relative to the elevation of the top of monitoring well MW-2 of 334.89 feet based on the elevation of this well used in previous investigations of the Site.

The data show that the groundwater gradient at the time of sampling was almost flat across the Site, with a slight hydraulic gradient of approximately 0.0008 ft/ft, flowing to the northeast towards the Pemigwasset River (**Figure 6**). Please note that the gradient and flow direction were calculated from a limited number of wells. Additional wells may be needed to confirm the predominant groundwater flow direction.

6.2 GROUND PENETRATING RADAR RESULTS

DigSmart identified a potential UST west of the former building foundation. DigSmart also identified subsurface anomalies on the northern and eastern sides of the former building and beneath the northern portion of the foundation slab. These locations were investigated during test pitting activities at the Site.

6.3 SURFICIAL SOIL SAMPLE RESULTS

No visual and/or olfactory evidence of contamination was observed in the field in any of the surficial soil samples collected at the Site. PID readings were non-detect for all surficial soil samples collected. XRF field screening detected Cr in sample CA-SS-2 at a concentration that exceeded the applicable NHDES SRS. No concentrations of any other RCRA 8 metals were detected in surficial soil samples exceeding the applicable NHDES SRS. Surficial soil sample field screening results are summarized in **Table 2** and **Table 3**.

Laboratory analyzed surficial soil sample CA-SS-3 contained the PAH benzo[a]pyrene at a concentration (0.71 mg/kg) which exceeded the applicable NHDES SRS of 0.70 mg/kg. Results for surficial soil samples CA-SS-1 and CA-SS-2 indicated that these samples contained no PAHs above practical quantitation limits (PQLs). Surficial soil sample laboratory results are summarized in **Table 5**. Locations where NHDES SRS were exceeded are depicted on **Figure 4**.

6.4 TEST PIT SAMPLE RESULTS

Thirteen (13) test pits were excavated by Credere during this Phase II ESA work (CA-TP-7, CA-TP-7A, and CA-TP-8 to CA-TP-18. Test Pits TP-1 to TP-6 were previously completed by others. Test pits TP-1 and TP-2 were reportedly located off of the Site in the adjacent paved parking lot on Tannery Street.

Tannery waste in the form of thin layers of hides were observed in test pits CA-TP-9 (2 to 6 feet bgs), CA-TP-13 (4 to 5 feet bgs), and CA-TP-14 (4 to 8 feet bgs). No other visual and/or olfactory evidence of contamination was observed in the field in any of the test pit soil samples collected at the Site. PID readings ranged from non-detect to 2.4 ppm_v for all test pit soil samples collected.

XRF field screening indicated that Cr was present at concentrations exceeding the applicable NHDES SRS of 130 mg/kg for Cr VI in test pits CA-TP-8 (6 to 8 feet bgs), CA-TP-9 (0 to 4 feet bgs), CA-TP-13 (2 to 4 feet bgs), and CA-TP-14 (6 to 8 feet bgs). XRF field screening also indicated that arsenic (As) was present at concentrations exceeding the applicable NHDES SRS of 11 mg/kg in test pits CA-TP-8 (0 to 4 feet bgs), CA-TP-10 (0 to 4 feet bgs), and CA-TP-11 (0 to 2 and 4.5 to 6.5 feet bgs). Test Pit soil sample field screening results are summarized in **Table 2** and **Table 3**.

The laboratory analytical sample collected from test pit CA-TP-14 at 6 to 8 feet bgs contained total Cr at a concentration (260 mg/kg) which exceeded the NHDES SRS of 130 mg/kg for Cr VI. This sample was then analyzed for Cr VI, and was found to contain a concentration of Cr VI (4.5 mg/kg) that was below the applicable NHDES SRS. This indicates that only 1.7% of the Cr in this sample was in the Cr VI state. Therefore, no exceedance of the applicable NHDES SRS was identified.

The laboratory analytical sample collected from test pit CA-TP-15 at 5 to 7 feet bgs contained the PAHs benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene at concentrations which exceeded their applicable NHDES SRS.

No other soil samples from the Site test pits exceeded applicable NHDES SRS for any of the laboratory analyzed parameters. Test pit soil sample laboratory analytical results are summarized in **Table 5**. Locations where NHDES SRS were exceeded are depicted on **Figure 4**.

6.5 SUB-SLAB SOIL GAS SAMPLE RESULTS

No VOCs in soil gas exceeded the applicable vapor intrusion guidelines for commercial soil gas in samples collected from the Site during this Phase II ESA. Soil gas laboratory results are summarized on **Table 7**.

6.6 SOIL BORING SAMPLE RESULTS

As indicated previously, an aromatic odor was observed in all soil samples collected from soil boring CA-1, CA-4, and CA-5. However, no other visual and/or olfactory evidence of contamination was observed in the field in any of the soil boring soil samples collected at the Site. PID readings ranged from non-detect to 10.2 ppm_v for all boring soil samples collected.

XRF field screening indicated that Cr was present at concentrations exceeding the applicable NHDES SRS of 130 mg/kg for Cr VI in soil borings CA-1 (2 to 4 feet bgs), CA-2 (0 to 2 and 6 to 8 feet bgs), and CA-3 (0 to 18, 20 to 28, and 30 to 32 feet bgs). XRF field screening also indicated that Hg was present at concentrations exceeding the applicable NHDES SRS of 6 mg/kg in soil boring CA-3 (0 to 20 and 22 to 32 feet bgs). XRF field screening also indicated that Pb was present at concentrations exceeding the applicable NHDES SRS of 400 mg/kg in soil boring CA-3 (2 to 4 feet bgs). Soil boring sample field screening results are summarized in **Table 2** and **Table 3**.

In contrast to the field screening results, laboratory results for soil samples collected from locations CA-1, CA-2, CA-3, CA-4, and CA-5 contained no contaminants exceeding the applicable NHDES SRS. Soil boring sample laboratory results are summarized on **Table 5**.

6.7 GROUNDWATER SAMPLE RESULTS

Groundwater from well CA-2 was observed to have a petroleum odor during the two times it was sampled (July 5 and 14, 2011). 1,2,4-trimethylbenzene was quantified at 710 µg/L in the groundwater sample collected from monitoring well CA-2 on July 5, 2011 exceeding the applicable NHDES AGQS of 330 µg/L.

Concentrations of *total* Cr and Pb exceeding their respective NHDES AGQS were quantified in the groundwater sample collected from monitoring well CA-2 on July 5, 2011; however concentrations of *dissolved* Cr and Pb collected on July 14, 2011 were below the applicable NHDES AGQS. Therefore, no exceedances of the applicable NHDES AGQS for Cr and Pb were identified.

No other analytes exceeded their applicable NHDES AGQS in groundwater samples collected from the Site during this Phase II ESA. Groundwater sample laboratory results are summarized on **Table 8**.

6.8 BUILDING MATERIAL/DEBRIS RESULTS

6.8.1 Potential Asbestos Containing Material

Light blue 12-inch square floor tiles (Bulk product sample D-1) remaining on the former building slab were found to be ACM (containing 5% chrysotile). These floor tiles are present in one area of the former building floor slab (see **Figure 4**). These tiles are in a highly degraded state. No other samples were analyzed to be ACM. Building material laboratory results are summarized on **Table 6**. The laboratory analytical report is included in **Appendix F**.

6.8.2 Potential PCB-Containing Material

The blue floor coating (sample D-Floor Covering) that covers much of the northern portion of the former building foundation was found to contain no PCBs above the laboratory practical quantitation limit (PQL).

Soil from the electrical pit ("Transformer Pit") and two concrete samples (CA-CC-1 and CA-CC-2) from oil-stained concrete in an area where a transformer may have been located were found to contain no PCBs above the laboratory PQL.

Building material laboratory results are summarized on **Table 6.** The laboratory analytical report is included in **Appendix F**.

7. QUALITY ANALYSIS/QUALITY CONTROL

The contracted laboratory, Absolute Resource Associates (ARA) of Portsmouth, New Hampshire, provided Level II analytical data according to EPA protocols, EPA laboratory data validation guidance, and the SSQAPP. The laboratories provided the following information in analytical reports:

- Data results sheets
- Method blank results
- Surrogate recoveries and acceptance limits
- Duplicate results/acceptance limits
- Spike/duplicate results/acceptance limits
- Laboratory control sample results
- Description of analytical methods and results
- Other pertinent results/limits as deemed appropriate

As outlined in the SSQAPP, at the completion of the field tasks and upon receipt of the analytical results, a data usability analysis was conducted to document the precision, bias, accuracy, representativeness, comparability, and completeness of the results. The following sections present this analysis.

7.1 PRECISION

Precision measures the reproducibility of measurements. The precision measurement is established using the relative percent difference (RPD) between the sample and duplicate results. Relative percent differences were calculated for soil samples where both sample and duplicate values were greater than five times (5X) the PQL of the analyte. The acceptable upper limit for RPD is 35%. The RPD is calculated as follows:

$$\text{RPD (\%)} = \frac{\text{(Sample Result - Duplicate Result)} \times 100}{\text{Mean of the Two Results}}$$

The following duplicate samples were collected during this Phase II ESA:

- CA-TP-DUP-1 (duplicate soil sample collected at test pit location CA-TP-14 from 6 to 8 feet bgs) and analyzed for VOCs, PAHs, and RCRA 8 metals plus Cu, Ni, and Zn.
- CA-TP-DUP-2 (duplicate soil sample collected at test pit location CA-TP-9 from 6 feet bgs) and analyzed for TPH.

Table 9 summarizes the duplicate sample results and RPDs.

The duplicate concentrations of barium in samples CA-TP-14/CA-TP-DUP-1 had a RPD of 64.7%, which exceeded the limit of 35%. However, both barium concentrations (47 and 92

mg/kg were below the NHDES SRS of 1,000 mg/kg. Therefore, Credere does not believe that this lack of precision affects the conclusions of this Phase II ESA.

7.2 BIAS

Bias is the systematic or persistent distortion of a measurement process that causes errors in one direction. Bias assessments are made using personnel, equipment, and spiking materials or reference materials as independent as possible from those used in the calibration of the measurement system. Bias assessments were based on the analysis of spiked samples so that the effect of the matrix on recovery is incorporated into the assessment. A documented spiking protocol and consistency in following that protocol are important in obtaining meaningful data quality estimates.

Matrix spike and matrix spike duplicate samples (MS/MSD) were used to assess bias as prescribed in the specified methods. Acceptable recovery values were within the recoveries specified by each of the analysis methods. Control samples for assessing bias were analyzed at a rate as specified in the analytical SOPs and specified analytical methods.

The laboratory provides quality control non-conformance reports that indicate if Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD) and/or MS/MSD had low, failing, or high recoveries, and if the sample result was affected. Likewise, the laboratory reports any compounds that had failing RPDs in the LCS/LCSD pair or the MS/MSD pair. This indicates the percent difference between the laboratory sample and its duplicate or the spike and it's duplicate. According to the laboratory, unless noted in the non-conformance summary, all of the quality control criteria for these analyses were within acceptable limits. Specific comments from the laboratory included:

VOCs

The MLCS/D4295 did not meet the acceptance criteria for chloromethane. This compound showed high recovery. There is no impact to the data as this analyte was not detected in the associated samples. The MLCS/D4295 did not meet the acceptance criteria for dichlorodifluoromethane. The MLCSD4295 did not meet the acceptance criteria for bromomethane. The recovery was acceptable in the LCS. These compounds are known to be problematic in the method.

The MLCS/D4307 did not meet the acceptance criteria for dichlorodifluoromethane and vinyl chloride. These compounds are known to be problematic in the method.

PCBs

The relative percent difference between the LCS4305 and LCSD4305 was outside the acceptance criteria for PCB-1016 and PCB-1260. The percent recovery for these analytes in each QC parameter was within the acceptance criteria. No impact to the data suspected.

PAHs/SVOCs

The LCS/D4327 did not meet the acceptance criteria for phenol and 4-nitrophenol. These compounds are known to be problematic in the method.

7.3 ACCURACY

Accuracy is a statistical measurement of correctness and includes components of random error (variability due to imprecision) and systemic error. It, therefore, reflects the total error associated with a measurement. A measurement is accurate when the value reported does not differ from the true value or known concentration of the spike or standard. For VOCs and PAHs, surrogate compound recoveries are also used to assess accuracy and method performance for each sample analyzed. Analysis of performance evaluation samples are also used to provide additional information for assessing the accuracy of the analytical data being produced. Both accuracy and precision are calculated for each analytical batch, and the associated sample results are interpreted by considering these specific measurements.

The laboratory provides a non-conformance summary that reports if all of the quality control criteria including initial calibration, calibration verification, surrogate recovery, holding time and method accuracy/precision for analysis were within acceptable limits. According to the laboratory, unless noted in the non-conformance summary, all of the quality control criteria for these analyses were within acceptable limits.

7.4 REPRESENTATIVENESS

Objectives for representativeness are defined for each sampling and analysis task and are a function of the investigative objectives. Representativeness was accomplished during this project through use of standard field, sampling, and analytical procedures.

All objectives for sampling and analytical representativeness for samples that were analyzed, as specified in the SSQAPP Addendum, were met.

7.5 COMPARABILITY

Comparability is the confidence with which one data set can be compared to another data set. The objective for this QA/QC program is to produce data with the greatest possible degree of comparability. Comparability was achieved by using standard methods for sampling and analysis, reporting data in standard units, normalizing results to standard conditions and using standard and comprehensive reporting formats. Complete field documentation was used, including standardized data collection forms to support the assessment of comparability. Historical comparability shall be achieved through consistent use of methods and documentation procedures throughout the project.

7.6 COMPLETENESS

Completeness is calculated by comparing the number of samples successfully analyzed to the number of samples collected. The goal for completeness is 95 percent. The completeness for this project was 100 percent, as there were no samples that could not be analyzed due to holding time violations, samples spilled or broken, or any other reason.

8. CONCEPTUAL SITE MODEL

This Phase II ESA was designed to provide further understanding of the contaminants at the Site and to aid in changing the Site use from industrial to recreational. The following section is a description of the Conceptual Site Model (CSM), which incorporates information from this investigation.

8.1 CONTAMINANTS OF CONCERN

Based on the results of this Phase II ESA, the following COCs were identified at the Site:

- 1,2,4-trimethylbenzene in groundwater
- Benzo[a]pyrene in surficial soil
- The PAHs benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene in subsurface soil
- Asbestos in floor tiles on the former building foundation slab

8.2 SITE GEOLOGY AND HYDROGEOLOGY

The Site is located near the west bank of the Pemigewasset River in a developed area of Franklin, New Hampshire. The eastern adjoining property between the Site and river is currently undeveloped. Area topography generally slopes east towards the river. Storm water at the Site likely follows surficial topography and is directed into the river.

Soil boring and test pit data obtained from this Phase II ESA and from reports that were reviewed as a part of the Phase I ESA indicates that soil beneath the Site consists of a mixture of sand and gravel with some areas of fill material that includes tannery waste (hides) on the east side of the Site. The water table was identified at approximately 28 feet bgs.

8.3 DEFINITIONS OF EXPOSURE PATHWAYS AND POTENTIAL RECEPTORS

To aid in a thorough understanding of the environmental concerns present at the Site, a graphical presentation of the identified COCs and potential migration pathways to receptors is included as **Figure 8**. Exposure Pathways and Potential Receptors depicted on the CSM are defined as follows.

Exposure Pathways describe how a human or environmental receptor comes into contact with contaminants which may be present at the Site. Exposure pathways presented in the CSM include the following:

- Inhalation: This pathway is primarily associated with groundwater contamination within 30 feet of an occupied structure when groundwater elevation is less than 15 feet below surface grade, or when depth to groundwater is unknown. This pathway is applicable when receptors may inhale impacted media in the form of vapor.

- Dermal Absorption: Exposure via dermal absorption occurs when receptors are exposed to chemical concentrations present in soil, groundwater, or surface water through direct contact with the skin.

- Active Ingestion: The Active Ingestion pathway represents exposure which may occur through the active ingestion of contaminant concentrations via a drinking water supply well or through agricultural products.

- Incidental Uptake: This pathway is applicable when receptors may incidentally ingest or inhale impacted media in the form of dust or airborne particulates.

Potential Receptors are categorized by duration of exposure and intensity of use at the Site. The receptor categories for this project described in the CSM include the following:

- Commercial: Commercial receptors are those which are present at the Site for long durations but with low intensity exposure such as indoor office workers.

- Site Worker: Site workers are present at the Site for short durations though intensity of use is high, such as during non-routine activities including construction or utility work. Examples include outdoor commercial workers and construction workers.

- Visitor: Visitors are characterized by low duration, i.e. less than two hours per day, and low intensity usage such as that which would occur during activities such as walking, shopping, and bird watching.

- Terrestrial and Aquatic Biota: These receptors include flora and fauna which may be exposed to contaminants in their respective land-based or aquatic environments.

Please note that the Site is not anticipated to be used for residential purposes. Therefore, residential receptors are not evaluated as part of this CSM.

Based on known history of the Site, the identified COCs may have been released to the environment through surficial and subsurface releases associated with previous industrial usage, filling with tannery waste, the degradation of hazardous building materials, and previous bulk petroleum storage. Primary impacted media at the Site include surficial soil, subsurface soil, and groundwater.

The PAH benzo[a]pyrene in surficial soil and asbestos in exposed floor tiles may migrate through aeolian dispersion and impact on-site or off-site receptors. Both asbestos and PAHs have low propensity to leach and are unlikely to affect subsurface conditions through infiltration and leaching. Potential receptors identified for the Site include future commercial workers, site workers (i.e. construction workers, etc.), and visitors, as well as terrestrial biota. Potential exposure pathways for these human receptors to PAHs or asbestos include incidental uptake (including inhalation). Receptors may also be exposed to PAHs via dermal absorption.

The PAHs in subsurface soil are unlikely to migrate unless disturbed during future Site work. Human receptors identified for the Site include future site workers (i.e. construction workers, etc.) who could be exposed via dermal absorption or incidental ingestion (including inhalation).

The 1,2,4-trimethylbenzene identified in groundwater at the Site has likely leached and infiltrated from an upgradient on-site subsurface soil source area. This potential source area was not defined by this Phase II ESA. Human receptors identified for the Site include future site workers (i.e. construction workers, etc.) who could be exposed via dermal absorption or incidental ingestion (including inhalation).

9. DEVIATIONS

The following deviations were made from the SSQAPP Addendum (see **Appendix A**) during the course of the investigation:

1. Soil boring CA-2 and test pit CA-TP-13 were moved from their proposed locations in the SSQAPP. These sampling locations were proposed to assess a possible septic tank which was suspected of discharging to the adjacent Pemigwasset River. Based on field observations and information obtained from City of Franklin public works employee, it was determined that this tank was connected to the City sanitary sewer system. Based on this information, Credere determined that this tank did not require assessment, and soil boring CA-2 and test pit CA-TP-13 were moved approximately 30 to 40 feet to the southwest to assess possible buried tannery waste.

2. Soil borings CA-4 and CA-5 were not installed through the bottoms of the former press pits, because the drill rig augers could not penetrate the reinforced concrete at the bottom. Instead, these soil borings were moved several feet to the east and were advanced immediately adjacent to the sidewalls of the press pits.

3. Due to the depth to groundwater at the Site, Credere did not have the proper equipment to field filter metals samples from CA-2 and CA-3 when they were first sampled on July 5, 2011. Credere therefore opted to collect unfiltered samples in the HNO_3-preserved laboratory HDPE bottles. These samples therefore represented *total* metals samples which deviated from the specification in Credere's NHDES and EPA approved SSQAPP. The SSQAPP called for the collection of samples for *dissolved* metals. To meet the SSQAPP requirement, Credere returned to the Site on July 14, 2011 and re-sampled monitoring well CA-2, and the sample was field filtered prior to placing it in appropriate glassware. It is worth noting that monitoring well CA-3 was not re-sampled because no contaminants were detected above AGQS in this well.

10. DATA GAPS

The source of gasoline contamination of groundwater detected at monitoring well CA-2 has not been identified, and the extent of groundwater contamination has not been fully delineated. No other data gaps have been identified for the Site.

11. CONCLUSIONS

Our conclusions in relation to the identified RECs and other environmental concerns, and the investigation results are presented below:

11.1 RECOGNIZED ENVIRONMENTAL CONDITIONS

- REC-1, which was associated the presence of a 12,000-gallon fuel oil underground storage tank (UST) (identified as UST-6) that was closed-in-place in the vicinity of the loading dock, is dismissed because no evidence of contamination was identified in soil samples collected from the sides and adjacent to the bottom of the closed-in-place UST in test pits CA-TP-7 and CA-TP-7A. In addition, observations made by Credere indicated that this UST was filled with clean sand at the time of closure-in-place.
- REC-2, which was associated with the potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-8) shown on a historical Sanborn Map, is dismissed because no UST was identified in this location during the GPR survey and no evidence of contamination exceeding applicable standards was identified in test pits CA-TP-8, CA-TP-10, or CA-TP-11.
- REC-3, which was associated with the potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-9) shown on a historical Sanborn Map, is dismissed because no UST was identified in this location during the GPR survey, and no evidence of contamination was identified in test pit CA-TP-9 or in soil gas sample locations CA-SG-1 through CA-SG-5, which were completed to evaluate this REC.
- REC-4, which was associated with a former fuel dispenser and a number of filling caps formerly located in the vicinity of the closed-in-place UST-6, is dismissed because no evidence of contamination exceeding applicable standards was identified is soil samples collected from test pit CA-TP-12, which was advanced in the suspected location a former fuel dispenser.
- REC-5, which was associated with the presence of a sheen of degraded gasoline previously noted in 2008 in existing monitoring well MW-2, is confirmed, because groundwater from a newly installed monitoring well (CA-2) located 30 feet southwest of MW-2 contained 1,2,4-trimethylbenzene at a concentration exceeding the applicable NHDES Ambient Groundwater Quality Standard (AGQS), suggesting that a plume of degraded gasoline is present beneath the Site.
- REC-6, which was associated with a subsurface structure identified during a previous GPR survey east of the former building and believed to be a former concrete septic tank, is dismissed because this structure was determined to be a part of the municipal sewer system and not a septic tank, and therefore does not represent a pathway to the subsurface environment.

- REC-7, which was associated with the presence of buried waste related to the previous usage of the Site as a tannery, is dismissed. While evidence of buried waste was observed in the form of leather hides in test pits CA-TP-9, CA-TP-13, and CA-TP-14, no evidence of contamination at concentrations exceeding applicable standards was observed in association with the buried waste. However, this condition represents a solid waste issue that should be properly managed.
- REC-8, which was associated with pipes that were previously noted emitting unknown solvent odors and elevated total volatile organic readings in the southwestern portion of the building, is dismissed, because no evidence of contamination exceeding applicable standards was identified in soil gas (soil gas sample locations CA-SG-6 through CA-SG-11), soil (boring CA-3), or in groundwater (monitoring well CA-3) samples collected from this area.
- REC-9, which was associated with former press pits located within the manufacturing slab that are stained with petroleum, is dismissed because no evidence of contamination was identified in soil samples collected from adjacent to the bottoms of the press pits (borings CA-4 and CA-5).
- REC-10, which was associated with a pile of demolition debris located on the southwestern portion of the Site, is dismissed because no potential lead-based paint or PCB-containing materials were observed in the pile, and no asbestos was identified in a floor tile sample collected from the pile.

11.2 ADDITIONAL ENVIRONMENTAL CONCERNS

The following additional environmental concerns were identified by Credere during development of the SSQAPP and assessed during this Phase II ESA:

- Potential impact associated with the former use of the Site for railroad activities is confirmed, because benzo[a]pyrene was detected above the applicable NHDES SRS in surficial soil sample CA-SS-3. Benzo[a]pyrene is a PAH which is known to be associated with railroad activities.
- The potential impact of a former electrical transformer located on the west side of the building is dismissed, because no PCBs were identified in soil collected from an electrical pit in this area of the Site. Additionally, two samples of stained concrete collected from this area of the Site contained no PCBs above laboratory practical quantification limits.
- A soil sample collected from test pit CA-TP-15 at 5 to 7 feet below ground surface (bgs) contained the PAHs benzo[a]anthracene, benzo[b]fluoranthene, benzo[k]fluoranthene, benzo[a]pyrene, indeno(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene at concentrations which exceeded their applicable NHDES SRS. No staining was observed in this test pit nor was this sample associated with any observed buried wastes. Additionally, no PAHs

were identified in soil in contact with buried waste in test pits CA-TP-13 or CA-TP-14. Although this test pit was not in the location of or downgradient of any identified Site USTs, it is Credere's opinion that this contamination may be associated with a past petroleum release from the former UST#10, which was located approximately 40 feet away or from another unknown on-site source.

- Building material sample results indicate that blue 12-inch square floor tile remnants remaining attached to the concrete building slab are asbestos-containing material (ACM). It is not clear if any of these tiles are present in the demolition pile remaining on-site.

12. RECOMMENDATIONS

Based on observations and results of this Phase II ESA for the Site, Credere makes the following recommendations:

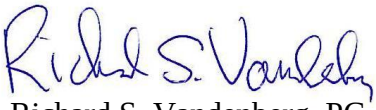
- Credere recommends that delineation of all buried solid waste at the Site be conducted, including tannery hides, other tannery wastes, and building demolition debris, per NHDES Solid Waste Rules Env-Sw 309 in support of a Pre-1981 landfill registration.
- Subsequent to the delineation of all buried solid waste at the Site, Credere recommends that the Site be registered as a Pre-1981 landfill according to NHDES Solid Waste Rules Env-Sw 309.
- Credere recommends that delineation of the identified PAH contaminated surficial soil in the areas of CA-SS-3 and CA-TP-15 be conducted. Credere recommends that a Remedial Action Plan (RAP) be developed to address the PAH contaminated soil.
- Credere recommends additional investigation to assess the full extent and magnitude of degraded gasoline contamination identified at monitoring well CA-2. This additional assessment should supplement the development of a groundwater flow model of the Site in order to define the nature, extent, and/or potential fate and transport characteristics of the identified impacted media. Credere also recommends that this petroleum contamination issue be referred to the NHDES Petroleum Remediation Program as the observed contamination is likely associated with one of the former USTs at the Site. If accepted into this program, future investigation work will be reimbursed by the program.
- Credere recommends that the identified ACM floor tile remaining on the former building slab be properly handled according to all applicable NHDES Asbestos and Solid Waste Rules prior to the development of the Site.

13. SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

The following Environmental Professionals performed this Phase II ESA in conformance with ASTM Standard Guide E 1903-97 (reapproved 2002). The following individual(s) meet the qualifications for individuals completing or overseeing all appropriate inquiries, and possess sufficient specific education, training, and experience necessary to exercise professional judgment to develop opinions and conclusions regarding the existence of environmental conditions on the Site. Any work completed on this Phase II ESA by an individual who is not considered an environmental professional was completed under the supervision or responsible charge of the environmental professional.

Jonathan O'Donnell
Geo-Environmental Engineer

Jedd Steinglass
Senior Geologist



Richard S. Vandenberg, PG
Senior Geologist

14. LIMITATIONS

This report has been prepared as part of a contract agreement between Credere Associates, LLC and LRPC for their Brownfields program. This agreement was established in order to provide LRPC with information upon which it can rely concerning the existence or likely existence of various environmental contaminants on or adjacent to the Site.

This report does not reflect:

1. Conditions in untested areas.
2. Variations in chemical concentrations that can occur between sample locations.
3. The total understanding of potential influences of off-site areas or historical uses that may have contributed or currently contribute to Site contamination, particularly relating to groundwater and subsurface soil conditions. The limited evaluation of off-site contamination sources was based on available data and records.
4. The potential presence of compound sources was based on available data and records.
5. The potential presence of analytes that were not analyzed for or that may be present below minimum Practical Quantification Limits for the methods tested.
6. The conditions of groundwater and/or surface water beyond available data.
7. Variation in the Site conditions that occurred at a time other than when the Site inspection was completed.

In the event that any conditions different from those described herein are encountered at a later time, Credere Associates, LLC requests an opportunity to review such differences and modify the assessment and conclusions of this report. This report was prepared expressly for the purpose described. The information in this report may not be suitable for any other use without adaptation for the specific purpose intended. Any such reuse of this report, without adaptation, shall be at the sole risk and liability of the party undertaking the reuse.

TABLES

<LOD - Concentration less than instrument level of detection

Highlighted cells have concentrations that exceed NHDES Soil Remediation Standards

* = The regulatory threshold for Cr VI was used because it is the most stringent standard for chromium

XRF - X-Ray Fluorescence Detector

bgs - below ground surface

TABLE 4
FORMER POLYCLAD LAMINATES SITE
45 TANNERY STREET - FRANKLIN NEW HAMPSHIRE
NHDES SITE NO. 199902062
SUMMARY OF GROUNDWATER ELEVATION DATA

MONITORING WELL ID		CA-1	CA-2	CA-3	MW-2
Pertinent Well Construction Details	WELL DEPTH[1] (FEET)	34.42	34.41	34.57	33.96
	LENGTH OF SCREEN (FEET)	10	10	10	10
	DEPTH TO TOP OF SCREEN[1] (FEET)	25	25	25	25
	TOP OF WELL ELEVATION[2] (FEET)	335.26	334.82	335.25	334.89
GROUNDWATER DEPTH[1] (FEET) July 5, 2011		28.02	27.57	27.75	27.64
GROUNDWATER ELEVATION[3] (FEET) July 5, 2011		307.24	307.25	307.50	307.25

Notes:

(1) All depth levels were gauged from top of well PVC riser. Well depth measurements were taken at the time of groundwater sampling, and may refect loss of well depth due to sedimentation.

(2) Top of Well Elevations were related, via stadia survey, to elevation of existing well MW-2 (334.89 ft) from Delta Phase II ESA, April 10, 2008. Elevations of wells CA-1 through CA-3 were surveyed by Credere on July 5, 2011.

(3) Groundwater elevations have been calculated by subtracting the depth to groundwater from the well elevations.

NOTES:

[1] Only analytes identified above detection limit are summarized .

[2] New Hampshire Soil Remediation Standards from the Risk Characterization Management Policy Env-Or 606.19, Soil Remediation Criteria.

* = The regulatory threshold for Cr VI was used because it is the most stringent standard for chromium, except for sample CA-TP-14, which was analyzed for both total chromium and Cr VI.

** - PAHs were detected as part of the SVOC analysis. Results are presented with the PAH results.

J = Estimated value because detection was below practical quantitation limit.

M = Matrix spike recovery was outside the control limits of 75% - 125%. Matrix interference suspected.

NE = No regulatory guideline established

ND < 0.1 = Not detected above quantitation limit (i.e. 0.1 mg/kg)

NS = Not sampled for the analysis.

Bold Exceeds laboratory quantitation limit

Exceeds NH DES Soil Remediation Standards.

2. INTRODUCTION

The Lakes Region Planning Commission (LRPC) has received a United States Environmental Protection Agency (USEPA) Brownfields Hazardous Substance Assessment Grant to conduct environmental investigations at sites within the 30 member communities of the Lake Winnipesaukee Region. The investigations provide the basis for reuse planning specific to each site's community needs. The assessment of each site will include the completion of Phase I and Phase II Environmental Site Assessments (ESAs) and may also potentially include the development of cleanup and reuse options for selected sites.

On behalf of LPRC's Brownfields Assessment Program, this document is a Site-Specific Quality Assurance Project Plan (SSQAPP) Addendum for the Former Polyclad Laminates Property located at 45 Tannery Street, Franklin, New Hampshire (the Site). **Figure 1** shows the general location of the Site in Franklin and **Figure 2** is Credere's Organization and Responsibility Chart for the project and **Figure 3** is a plan showing the locations of proposed sampling work.

This SSQAPP presents the following information:

1. A summary of the pertinent findings of the Phase I ESA
2. The potential redevelopment scenario for the Site
3. A conceptual site model
4. Credere's proposed sampling design including recommended sample locations, and analytical methods for proposed Phase II ESA activities
5. Credere's proposed field activity methodology
6. Regulatory standards applicable to the Site
7. A proposed project schedule

This SSQAPP was prepared to be used in concert with Credere Associates, LLC (Credere) Generic Quality Assurance Project Plan (QAPP) Rev. 2 (USEPA RFA #08166 and #09036) which was prepared for all of Credere's USEPA work in New Hampshire. The quality assurance and quality control (QA/QC) procedures outlined in Credere's Generic QAPP will be followed for this investigation program including sample collection, handling, and analysis, chain of custody, data management and documentation, data validation, and data usability assessments.

3. FINDINGS OF THE PHASE I ESA

A Phase I ESA was completed by Nobis Engineering, Inc. (Nobis) for the Site in April 2011. The Phase I ESA was conducted using EPA Brownfields funds under Brownfields Coalition Assessment Grant #RP-96128501 at the direction of the New Hampshire Department of Environmental Services (NHDES).

The following is a summary of the pertinent findings from the Phase I ESA:

3.1 SITE DESCRIPTION AND HISTORY

The Site is composed of a single vacant 1.97-acre parcel of land located at 45 Tannery Street in Franklin, New Hampshire, that is situated along the Pemigewasset River. The Site consists of a vacant lot with only the former building's concrete slab-on-grade foundation and a small pile of debris. **Figure 3** shows the former site building footprint and other pertinent Site features.

According to Nobis's Phase I ESA report, which was reviewed as a part of the development of this SSQAPP, the Site was first developed in 1892. By approximately 1930, the first building was constructed on the Site. The most recent building was demolished in 2008 after it collapsed due to heavy winter snow cover.

According to the Nobis Phase I ESA report, the Site appears to be have used for railroad purposes when the Boston & Maine and Bristol Rail Road transected the Site beginning in 1892. It is not clear when railroad activities ceased on the Site. However, records do show that the Hingston Leather Company, Inc. and Louis Verza Leather Company were using the Site for tannery activities beginning in the 1950's until the mid to late 1970's. Nobis indicated that there was very little environmental information available for the Site as it pertains to the former tannery operations.

Between 1979 and 1980, Polyclad Laminates, Inc. began operations on the Site. Polyclad Laminates, Inc. manufactured component materials used in multi-layered circuit boards called "pre-preg". The process involved dipping fiberglass cloth in a dip tank filled with epoxy resin. Polyclad Laminates used the Site for the manufacture of pre-preg from between 1979 and 1980 until around 2006.

3.2 OTHER DOCUMENTED PREVIOUS ENVIRONMENTAL WORK CITED BY NOBIS

The Nobis Phase I details the completion of several other investigations, which were completed outside the Brownfields due diligence process, likely as part of a previous effort to sell the Site. Documented previous works include the following:

1. A January 12, 1999 Underground Storage Tank (UST) Closure Report UST-1 prepared by Les A. Cartier and Associates, Inc.
2. A July 15, 1999 UST Closure Report UST-2, UST-3 and UST-4 prepared by Environmental Science & Engineering (ESE).
3. A 2005 Phase I Environmental Site Assessment and Limited Compliance Review prepared by Delta Consultants.
4. An April 10, 2008 Phase II Environmental Site Assessment prepared by Delta Consultants.
5. An October 15, 2008 UST Closure Report UST-7 and UST-10 prepared Delta Consultants.

The conditions identified by Nobis in **Section 3.4** below cumulatively considered all the above referenced previous investigations. Credere also reviewed and considered this cumulative work as a part of the development of this SSQAPP.

3.3 HISTORY OF TANKS AT THE SITE

The operational history of USTs is an important element in the environmental history of the Site. As result, the information below, as reported by Nobis in the April 2011 Phase I ESA, provides an inventory of the USTs which have been identified at the Site. Additional details concerning UST history can be reviewed in the previously submitted Nobis Phase I ESA.

UST ID	Capacity (gallons)	Material Held	Current Status
UST -1	6,000	Methyl Cellosovle	Removed, 1998
UST-2	4,500	CS 350 Acetone	Closed in-place, 1998
UST-3	4,500	Epoxy Resin	Closed in-place,1999
UST-4	6,000	CS 350 Acetone	Closed in-place, 1999
UST-5	4,000	Gasoline	Removed, date uncertain.
UST-6	12,000	Fuel Oil	Closed in-place, date uncertain
UST-7	13,500	Epoxy Resin	Removed 2008
UST-8	4,000	Fuel Oil	Approximate location from 1964 Sanborn Map
UST -9	4,000	Fuel Oil	Approximate location under slab from 1929 Sanborn Map
UST-10	8,000	Waste Petroleum Distillates	Removed 2008

3.4 IDENTIFIED RECOGNIZED ENVIRONMENTAL CONDITIONS

The following is a summary of the *recognized environmental conditions* (RECs) that were identified by Nobis and reported in their April 2011 Phase I ESA for the Site:

1. The presence of a 12,000-gallon fuel oil UST (identified as UST-6) that is located in the vicinity of the loading dock and was closed in-place (date uncertain) represented a REC.

2. The potential presence of a reported 4,000-gallon fuel oil UST (identified as UST-8) shown on a Sanborn Map, represented a REC because the presence of this tank has not been confirmed and no documentation regarding closure of the tank or information on the integrity of the tank was identified during the Phase I ESA.

3. The potential presence of a reported 4,000-gallon fuel oil (identified as UST-9) shown on a Sanborn Map, represented a REC because the presence of this tank has not been confirmed and no documentation regarding closure of the tank or information on the integrity of the tank was identified during the Phase I ESA.

4. Due to the potential for undocumented past releases to the environment, Nobis identified a REC associated with presence of a former gasoline dispenser and a number of filling caps formerly located in the vicinity of former UST-6 because these items may have been associated with additional undocumented USTs in this area, and documentation regarding the removal of this dispenser or the disposition of related piping with respect to potential releases has not been confirmed.

5. The presence of a sheen of degraded gasoline previously noted in 2008 in monitoring well MW-2 for which a source was not identified, represents a REC due to the potential for an unidentified source of petroleum contamination to be present at the Site. [Note: According to a Phase II Environmental Site Assessment Report prepared by Delta Consultants on April 10, 2008, previous sampling data collected in 2007 indicates that no VOCs, metals or polychlorinated biphenyls (PCBs) were detected in excess of New Hampshire Soil Remediation Standards (SRS) in a soil sample collected (30 to 32 feet) during drilling of this well and no volatile organic compounds (VOCs) or semi-volatile organic compounds (SVOCs) were detected in excess of Ambient Groundwater Quality Standards (AGQS) in the groundwater sample collected from this well. However, a petroleum sheen was noted during sampling of the groundwater and the tentatively identified compounds (TICs) noted during laboratory analysis revealed that the sheen was likely gasoline.]

6. The potential that a subsurface structure identified during a GPR survey east of the former building, which was concluded to be a former concrete septic tank, represents a REC because of the potential for previous undocumented subsurface storage or disposal of hazardous substances and/or petroleum products in and around this structure.

7. The presence of buried waste related to the previous usage of the Site as a tannery represents a REC because the understanding of the extent and disposition of the waste (leather waste or unsuitable materials) is limited and may have lead to improper disposal of hazardous substances.

8. Nobis concluded that because of the potential for undocumented releases of hazardous substances in the past or in the future, pipes that were previously noted emitting unknown solvent odors and elevated total volatile organic readings in the former chemical mixing room in the southwestern portion of the building, represented a REC because the source of these odors (which may be a formerly closed in-place acetone tank) is not known.

9. Two former press pits located within the manufacturing slab that are stained with petroleum represent a REC and they have not been fully assessed.

10. A pile of unknown debris located on the southwestern portion of the Site that is consistent with demolition debris represents a REC for its potential to contain waste ACM, lead-based paint [and other contaminants].

3.5 OTHER POTENTIAL ENVIRONMENTAL CONDITIONS

Based on review of the April 2011 Nobis Phase I ESA, Credere offers the following list of other potential environmental conditions:

1. Nobis documented that the Site was previously used for railroad activities beginning as early as 1892. Nobis concluded that this past use of the Site represented a *de minimus condition* because any contaminants from this past use would likely be deemed a background condition. Credere agrees with this assertion, but it is our opinion that non-point source background type releases of polycyclic aromatic hydrocarbons (PAHs), which would be considered the primary contaminants of concern, still represent a threat to human health if they exceed applicable NHDES soil standards and should be addressed as a part of future redevelopment of the Site. Therefore, it is our opinion that this past use should be assessed as a part of this Phase II ESA.

2. Nobis indicated in the Phase I ESA that a data gap in the form of snow cover was noted during the Site Reconnaissance portion of their work. Given that the ground could not be observed, confirmation of exterior surface conditions is warranted prior commencing Phase II ESA field work because additional RECs may be identified that require assessment. As a result, a supplemental Site Reconnaissance is recommended as the first task of this Phase II ESA.

3. A former electrical transformer was located on the west side of the building. No information was noted in the previous reports regarding the potential presence of polychlorinated biphenyl's (PCBs) in the transformer. However, considering the timeframe when this transformer would have been in operation, it may have contained

PCBs. For this reason, the potential presence of PCBs is a concern that should be considered.

4. POTENTIAL REDEVELOPMENT SCENARIO

The City of Franklin has partnered with LRPC to assess the Site so that the City can redevelop the Site into a new Water Department Building or other related municipal use.

5. CONCEPTUAL SITE MODEL

The Conceptual Site Model (CSM) includes a description of source areas and/or RECs, the nature and extent of the identified or suspected releases, potential contaminants of concern (COCs), impacted media, transport mechanisms, and potential human and environmental receptors.

5.1 CONTAMINANTS OF CONCERN

Based on the findings of the Phase I ESA, the following potential COCs were identified for each of the RECs identified at the Site:

Table 1 - Potential Contaminants of Concern (COCs)

REC	REC Nickname	COCs	Potential Source
REC-1	UST-6	Volatile Organic Compounds (**VOCs**) **PAHs** Total Petroleum Hydrocarbons (**TPH**)	Fuel oil releases from the closed in-place 12,000 gallon UST (UST-6)
REC-2	UST-8	**VOCs PAHs TPH**	Fuel oil releases from the potential presence of a 4,000 gallon UST (UST-8) that was documented on a 1964 Sanborn Map.
REC-3	UST-9	**VOCs PAHs TPH**	Fuel oil releases from the potential presence of a 4,000 gallon UST (UST-9) that was documented on a 1929 Sanborn Map.
REC-4	Filling Caps and Dispenser near UST-6	**VOCs Lead (Pb)**	Gasoline from past releases related to the use of filling caps, a dispenser, and undocumented USTs.
REC-5	Degraded Gasoline in MW-2	**VOCs Pb**	Gasoline from an undocumented source.
REC-6	Concrete Septic Tank	**VOCs** Semi-volatile Organic Compounds (**SVOCs**) **PCBs RCRA 8 Metals (Ag, As, Ba, Cd, Cr, Hg, Pb, and Se) Plus Zn, Cu and Ni)**	Tannery and multi-layered board manufacturing operational waste disposed of in the septic system and released to the environment.
REC-7	Buried Tannery Waste	**VOCs PAHs RCRA 8 Metals (Ag, As, Ba, Cd, Cr, Hg, Pb, and Se) Plus Zn, Cu, and Ni**	Leaching of contaminants from tannery wastes disposed outside around the building.
REC-8	Solvent Odor Emitting Pipe in Chemical Mixing Room	**VOCs**	Acetone releases from a pipe that may lead to a previously closed in-place tank.

Table 1 - Potential Contaminants of Concern (COCs)			
REC	**REC Nickname**	**COCs**	**Potential Source**
REC-9	Press Pits	**VOCs** **SVOCs** **TPH** **PCBs** **RCRA 8 Metals (Ag, As, Ba, Cd, Cr, Hg, Pb, and Se) Plus Zn, Cu, and Ni**	Releases of tannery and/or multi-layered board manufacturing waste through the press pits.
REC-10	Building Waste Debris Pile	**Lead** Asbestos Containing Materials (**ACMs**) **PCBs**	Building materials containing hazardous substances.
Other	Rail road Use of Site	**PAHs**	Non-point sources releases associated with past rail road activities on the Site.
Other	Transformer	**PCBs**	Former Electric Transformer on the west side of the building.

5.2 GEOLOGY, STORM WATER FLOW, AND GROUNDWATER FLOW

The Site is located near the west bank of the Pemigewasset River in a developed area of Franklin, New Hampshire. The eastern adjoining property between the Site and river is currently undeveloped. Area topography generally slopes east towards the river. Storm water at the Site likely follows surficial topography and is directed into the river.

Soil boring data contained in reports that were reviewed as a part of the Phase I ESA indicate that soil beneath the Site consists of a mixture of sand and gravel fill material with some areas of tannery waste (hides) noted on the east side of the Site. A fine to medium light brown to dark brown sand horizon is present below the fill horizon. The water table was identified between 28 and 30 feet below the surface.

5.3 DEFINITIONS OF EXPOSURE PATHWAYS AND POTENTIAL RECEPTORS

To aid in a thorough understanding of the environmental concerns present at the Site, a graphical presentation of the identified COCs and potential migration pathways to receptors is included as **Figure 4**. Exposure Pathways and Potential Receptors depicted on the CSM are defined as follows.

Exposure Pathways describe how a human or environmental receptor comes into contact with contaminants which may be present at the Site. Exposure pathways presented in the CSM include the following:

- Inhalation: This pathway is primarily associated with groundwater where petroleum contaminated groundwater is within 30 feet (horizontally or vertically), or non-petroleum contaminated groundwater is within 100 feet (horizontally or vertically) of an occupied structure, or when depth to groundwater is unknown. In addition, this pathway is applicable when receptors may incidentally inhale impacted media in the form of dust, vapor, or airborne particulates.

- Dermal Absorption: Exposure via dermal absorption occurs when receptors are exposed to chemical concentrations present in soil, groundwater, or surface water through direct contact with the skin.

- Active Ingestion: The active ingestion pathway represents exposure which may occur through the active ingestion of contaminant concentrations via a drinking water supply well or through agricultural products.

- Incidental Ingestion This pathway is applicable when receptors may incidentally ingest impacted media in the form of dust or airborne particulates.

Potential Receptors are categorized by duration of exposure and intensity of use at the Site. The receptor categories for this project described in the CSM include the following:

- Commercial: Commercial receptors are those which are present at the Site for long durations but with low intensity exposure such as indoor office workers.

- Site Worker: Site workers are present at the Site for short durations though intensity of use is high, such as during non-routine activities including construction or utility work. Examples include outdoor commercial workers and construction workers.

- Visitor: Visitors are characterized by low duration, i.e. less than two hours per day, and low intensity usage such as that which would occur during activities such as walking, shopping, and bird watching.

- Terrestrial and Aquatic Biota: These receptors include flora and fauna which may be exposed to contaminants in their respective land-based or aquatic environments.

Based on known history of the Site, the identified contaminants of concern may have been released to the environment through surficial and subsurface releases associated with previous industrial usage, filling with tannery waste, the degradation of potentially hazardous building materials, and previous bulk petroleum storage. Primary impacted media at the Site include surficial and subsurface soil, and groundwater.

Contaminants present in surficial soil may migrate through aeolian dispersion and impact off-site receptors, or they may affect subsurface conditions through infiltration and leaching. Similarly, releases which have impacted subsurface soil conditions have the potential to infiltrate and leach to the overburden groundwater aquifer. Following the redevelopment of the Site, impacted groundwater presents a potential risk to indoor air conditions through contaminant migration via vaporization and diffusion.

Human receptors identified for the Site include future commercial workers at the Site, site workers (i.e. construction workers, etc.), and visitors. Also, current and future potential environmental receptors include the Pemigewasset River and terrestrial and aquatic biota.

Exposure pathways to commercial workers at the site and visitors potentially include dermal absorption and incidental ingestion during routine activities. An inhalation exposure pathway also may exist for commercial workers through vapor intrusion. Site construction workers may be exposed through dermal absorption, inhalation, and incidental ingestion during excavation activities. Terrestrial and aquatic biota are potentially exposed through active ingestion of impacted groundwater; however, the active ingestion pathway does not currently nor is expected to pose a potential future pathway for human receptors, as the Site and adjacent properties in the vicinity are served by municipal water.

6. SAMPLING DESIGN

The following section describes the proposed work to be conducted to confirm or dismiss each REC and includes the number of samples that will be collected during the Phase II ESA sampling program along with the proposed analysis. Proposed sample locations are depicted on **Figure 3** and sampling methodologies are described in **Section 7**. Detailed descriptions of laboratory methods are included on attached **Table 2**.

REC-1: This REC will be assessed by first conducting a ground penetrating radar (GPR) survey of the area thought to contain the closed in-place 12,000-gallon fuel oil UST (UST-6) to determine its exact location. One test pit (CA-TP-7) will be dug immediately adjacent to the tank (**Figure 3**). During test pit activities, removed soil will be field screened with a properly calibrated photoionization detector (PID) at 1 to 2 foot depth intervals. Multiple test pits may be needed next to the tank to thoroughly evaluate the condition of the soil around it. One soil sample will be collected from the test pit (and interval) exhibiting the highest PID measurement. If PID measurements indicate that little to no residual VOCs are present, then a sample will be collected from adjacent to the tank, but at the same level as the bottom of the tank. For this and all in-place tanks that are being evaluate via test pit work, please note that Credere will consider the position of the tank when digging test pits. If the tank appears to be tipped (i.e. not horizontal), then Credere will direct the digging of the test pit along the deepest side or end. The collected soil sample will be sent to Absolute Resource Associates, LLC (Absolute Resource) of Portsmouth, NH to be analyzed for VOCs, PAHs, and TPH.

REC-2: This REC will be assessed by first conducting a GPR survey of the area thought to contain the 4,000-gallon fuel oil UST (UST-8) to determine its location. If the tank has not been removed, one test pit (CA-TP-8) will be dug immediately adjacent to the tank to assess the condition of the soil adjacent to the tank (**Figure 3**). Similar to above, multiple test pits may be needed next to the tank to thoroughly evaluate the condition of the soil around it. If the tank appears to have been removed and the tank grave can be discerned, Credere will install the test pit directly in the center of the perceived tank grave. During test pitting, removed soil will be field screened with a properly calibrated PID. One soil sample will be collected from the test pit (and interval) exhibiting the highest PID measurement. If PID measurements indicate that little to no residual VOCs are present, then a sample will be collected from adjacent to the tank, but at the level of the bottom of the tank. The collected soil sample will be sent to Absolute Resource to be analyzed for VOCs, PAHs, and TPH.

REC-3: This REC will be assessed by first conducting a visual inspection for evidence (e. g. fill, vents, concrete scars) of UST-9, a 4,000-gallon fuel oil UST. If the visual survey proves unsuccessful, a GPR survey will be conducted to locate it. If the tank has not been removed, portions of the concrete slab will be removed and one test pit (CA-TP-9) will be dug immediately adjacent to the tank to assess the condition of the soil

adjacent to the tank (**Figure 3**). Multiple test pits may be needed next to the tank to thoroughly evaluate the condition of the soil around it. If the tank appears to have been removed and the tank grave can be discerned, Credere will install the test pit directly in the center of the perceived tank grave. During test pitting, removed soil will be field screened with a properly calibrated PID at 1 to 2 foot depth intervals. One soil sample will be collected from the test pit (and interval) exhibiting the highest PID measurement. If PID measurements indicate that little to no residual VOCs are present, then a sample will be collected from adjacent to the tank, but at the level of the bottom of the tank. The collected soil sample will be sent to Absolute Resource to be analyzed for VOCs, PAHs, and TPH.

If a tank or evidence of tank is not identified during this work, five shallow soil probes (CA-SG-1 to CA-SG-5) will be installed through the concrete slab to collect soil gas to determine if the vadose zone under the slab has been impacted by contamination from the tank (i.e. looking for light component of fuel oil - naphthalene). The collected soil gas will be analyzed with a properly calibrated PID equipped with an 11.7 electron volt lamp. If this work reveals that volatile organics are present, one soil gas sample will be sent to Columbia Analytical for VOC analysis to identify the number and type of VOCs present. In this scenario, Credere will then install a boring (CA-1) adjacent to the soil gas probe exhibiting the highest result. During drilling, if field screening results indicate that soil contamination appears to extend down to the water table, then a groundwater monitoring well would be installed at this location. A groundwater sample will be collected to assess the groundwater for VOCs. In the absence of detectable concentrations of VOCs and other direct evidence of a tank, Credere will rely on groundwater quality data collected from MW-2 (which will be sampled as a part of assessing REC-5) to assess the potential for a source area of contamination to be present as part of this REC.

REC-4: The REC associated with the 'fill caps and dispenser' will be assessed by first conducting a GPR survey and/or electronic line tracing to determine if any tanks remain associated with this equipment. If this proves unsuccessful, then the filling caps will be dug up and manually traced. If a tank or tanks are identified associated with the fill caps, two test pits (CA-TP-10 and CA-TP-11) will then be dug adjacent to the tanks in a fashion similar to that described for REC-1, REC-2, and REC-3. For the purposes of this investigation, Credere has assumed that two tanks will be found and one test pit will be dug next to each. However, Credere also anticipates that one additional test pit will be dug in the location of the former dispenser (CA-TP-12). During test pitting, removed soil will be field screened with a properly calibrated PID at 1 to 2 foot intervals. Only the soil sample collected from each test pit (and interval) exhibiting the highest PID measurement will be sent to the laboratory. If PID measurements indicate that little to no residual VOCs are present, then one sample will be collected from the fill/native soil interface below the dispenser or the perceive level of bottom of any tank or tank grave(s). All collected soil samples will be sent to

Absolute Resource and analyzed for VOCs and lead. If no evidence of tanks are identified in this area, then only the one test pit (CA-TP-12) will be dug.

REC-5: The REC associated with the degraded gasoline identified in existing monitoring well MW-2 will be assessed in the following fashion:

1) Collect a groundwater sample from existing monitoring well MW-2 using low flow sampling techniques and analyze it for VOCs and dissolved lead.

Depending on the results of work conducted to assess REC-3, one of the following two paths will be taken to further evaluate REC-5 if the presence of degraded gasoline is confirmed in monitoring well MW-2.

2) Credere will evaluate field data collected from soil probes (CA-SG-1 to CA-SG-5) and monitoring well CA-1 to help locate the potential gasoline source for the MW-2 contamination. The results of this evaluation will be included in the Phase II ESA along with a specific recommendation for future work, if needed.

3) If the soil probes and upgradient monitoring well work was not completed as a part of the assessment of REC-3, then Credere will install five soil gas probes (CA-SG-1 to CA-SG-5) to locate the gasoline source under the building slab upgradient from MW-2, if it is present. Monitoring well CA-1 will be installed in the perceived area of highest VOC contamination based on field screening. CA-1 will be installed upgradient of MW-2 even if the soil gas results do not show the presence of a soil gas source under the building. As indicated as a part of the investigation of REC-3, one soil gas sample collected from the soil probes and will be sent to the laboratory for VOCs analysis. In addition, one soil sample will be collected from CA-1 and submitted to the laboratory for analysis of TPH, VOCs, and lead by EPA 200.7/6010 and one groundwater sample will be collected from CA-1 and submitted to the laboratory for VOCs and dissolved lead by EPA 200.7/6010.

REC-6: The REC associated with the suspected concrete septic tank will be assessed by first conducting a GPR survey to locate the tank. Once the tank is located, a test pit (CA-TP-13) will be dug immediately adjacent to the tank. Multiple test pits may be needed next to the tank to thoroughly evaluate the condition of the soil around it. During test pitting, removed soil will be field screened with a properly calibrated PID and X-Ray Fluorescence Meter (XRF) at 1 to 2 foot depth intervals. However, only one soil sample will be collected from the test pit (and interval) exhibiting the greatest evidence of contamination [visually, olfactory, PID and/or XRF measurement]. In the absence of evidence of contamination, the sample will be collected from adjacent to the tank, but at the level of the bottom of the tank. The collected soil sample will be sent to Absolute Resource to be analyzed for VOCs, SVOCs, PCBs and RCRA 8 Metals plus Zn, Cu, and Ni. In addition, if present, one (1) sample of sludge will be collected from the tank and analyzed for VOCs, SVOCs, PCBs, and RCRA 8 Metals plus Zn, Cu, and Ni. This sample will be field screened as described above.

The test pit work will help assess if there are pipes directed towards an old leachfield or discharge area. Additional geophysical work may be conducted to trace out the observed discharge line. At the terminus of the discharge, a boring (CA-2) will be drilled by T&K Drilling. During drilling, soils will be screened in the field via a properly calibrated PID and XRF. These samples will be visually inspected for evidence of contamination. In addition, the soil sample exhibiting the highest PID measurement or greatest visual extent of contamination, during drilling will be sent to the laboratory for analysis of VOCs, SVOCs, PCBs, and RCRA 8 metals. The boring will be finished in the water table and a monitoring well will be constructed to allow for the collection of a groundwater sample at this location. Groundwater will be collected from this location and will be analyzed for VOC, SVOCs, and dissolved RCRA 8 Metals plus Zn, Cu, and Ni. However, no PCB samples will be collected from the groundwater because we do not expect this parameter to dissolve in groundwater.

REC-7: The REC related to the presence of buried tannery waste (hides) will be assessed by first conducting a GPR survey to define, if possible, the horizontal extent of waste on the Site. Following the completion of GPR, up to five test pits (CA-TP-14 to CA-TP-18) will be dug to confirm the GPR results and to define the vertical limits of waste observed. Two of these test pits will be dug near the northern property boundary to determine if these wastes extend off-site. During test pitting, soil will be visually screened and evaluated with a properly calibrated PID and XRF. One representative soil sample from each test pit will be collected for laboratory analysis. Soil in direct contact with tannery waste will be selected to represent a worst case scenario. Samples will be sent to the Absolute Resource for VOCs, PAHs, and RCRA 8 Metals plus Zn, Cu and Ni.

REC-8: The REC associated with the pipes in the former chemical mixing room that was previously emitting solvent odors will be assessed by installing six (6) sub-slab soil gas probes (CA-SG-6 to CA-SG-11) to determine if past or present solvents being emitted are impacting the vadose zone beneath the concrete slab with VOCs. Locations CA-SG-6 to CA-SG-11 will be installed to evaluate this REC. Representative soil gas will be removed from each soil gas point and screened in the field with a properly calibrated PID. The sample with the highest PID measurement will sent to the laboratory for VOC analysis to determine the number and type of VOCs present. In addition, any piping present on-Site noted near closed in-place UST#2 would be field screened with a PID for evidence of solvent emission. If this data shows that the source of the solvent odors is likely a previously closed in-place tank, then a recommendation to remove the tank will be made in the Phase II ESA Report. A soil boring and monitoring well (CA-3) will be installed to assess the impact to Site soil and groundwater adjacent to the soil gas probe location that exhibited the highest field screening results. CA-3 will be installed at the location shown on **Figure 3** if no vapor source is identified during the soil probe work. This work will include appropriate

field screening as described above and the collection of one (1) soil sample and one (1) groundwater sample for laboratory VOC analysis.

REC-9: The REC associated with the press pits will be assessed by advancing two (2) soil shallow borings (CA-4 and CA-5) through the concrete bottom of the pits. Soil samples will be collected directly under the concrete slab to determine if substances added to the pit have released to the soil beneath the pits. Collected samples will be field screened with a PID and grab samples will be collected from both borings and laboratory analyzed for TPH, VOCs, RCRA 8 Metals plus Zn, Cu, and Ni, SVOCs, TPH, and PCBs.

REC-10: The REC associated with the debris pile identified on the concrete slab by Nobis will be assessed by collecting representative building material samples (Debris-1, etc.) and analyzing them for lead, asbestos, and PCBs. To accomplish this work, Credere will retain the services of Absolute Resources because the pile likely contains asbestos and sampling of the waste must be accomplished in accordance with NHDES requirements.

OTHER: Due to snow cover present during Nobis's Phase I Site Reconnaissance, the first task of this Phase II ESA will be to perform a supplemental Site Reconnaissance so that the ground can be viewed for evidence of RECs. If additional RECs are identified, the work plan will be revised and reapproved.

The former use of the Site for rail road activities will be assessed in two parts:

1) Credere will review available topographic maps and other historic sources to determine the former location of the rail road activities on-Site, and
2) Collect three (3) surficial samples (CA-SS-1, CA-SS-2, and CA-SS-3) from this area and analyzing them for PAHs. The locations shown on **Figure 3** are approximate and once research is completed the location of these surficial soil samples will be moved to the former rail-road right-of-way. If it cannot be location of the former right-of-way determined, the locations depicted on **Figure 3** will be sampled.

The former use of the of a potential PCB containing transformer on the west side of the Site building will be assessed by collecting two concrete samples of the transformer pad from immediately adjacent to the former transformer's location and analyzing them for PCBs.

Credere considered the collection of a background soil sample from the Site for metals and PAH analysis, but in order to be valid this would have to be from an area likely not impacted by previous site activities. Because all areas of the Site may have been impacted by previous historical site uses, no background sample is specified for this Phase II ESA. A background study with nearby off-site sampling may be recommended if the soil appear to be impacted by metals and/or PAHs within expected background ranges. However, during soil sampling work

the on-site geologist will be evaluating all collected soil samples for evidence of anthropogenic and native minerals that may present in samples because they could affect the laboratory results. These findings of this work will be discussed in our Phase II Report. Additional detail on what the field geologist will be looking for in soil samples is discussed in **Section 7**.

Table 2 includes the number and type of samples that are proposed be collected, cross-referenced with the appropriate standard operating procedure (SOP) that will be used from Credere's Generic QAPP. The data collected from these activities will serve as the basis for evaluating the Site conditions and will determine if any additional subsurface investigation and/or remedial actions are necessary. **Figure 3** shows the proposed locations where media will be collected. Requirements relative to Chain of Custody, Data Management and Documentation, Data Validation, and Data Usability Assessments contained in the Generic QAPP will be followed.

7. FIELD ACTIVITY METHODOLOGY

Field activity methodologies for assessing the RECs and other potential environmental concerns are summarized in the following subsections. Field activities will be conducted in accordance with the SOPs included in Credere's Generic QAPP Rev. 2 (USEPA RFA #08166 and #09036) and the rationale discussed in **Section 6**. Where field observations and/or field screening results indicate the presence of additional source areas or potentially impacted media, additional exploration locations or samples may be added to determine the horizontal and/or vertical extent of contamination. The number and locations of these additional soil samples or exploration locations will be dependent on field data, site constraints and professional judgment. All decisions regarding delineation will be recorded in the field logbook, and all locations will be documented. All soil samples obtained for the purposes of contamination delineation will be collected and field-analyzed in accordance with Credere's standard SOPs outlined on **Table 2**. If Credere determines these additional sample locations should be tested for analytes not described in **Table 2**, the USEPA QA Manager will be contacted, and pending the outcome of the communication, an email update will be provided to the USEPA describing the additional sample analysis, methods and SOPs.

7.1 GPR SURVEY AND ELECTRONIC TRACING

DigSmart of Maine, Inc. will conduct the GPR survey and will perform the work in accordance with the CREDERE SOP #007 provided in the generic QAPP.

7.2 SOIL BORINGS, TEST PITTING, SURFICIAL SOIL SAMPLING, AND FIELD SCREENING

Soil samples will be collected from soil borings and test pits in accordance with NHDES SOP HWRB-11 for soil sampling. Soil borings will be completed using hollow stem auger methodologies. During soil boring advancement, soil samples will be continuously collected in 2-foot split spoon samplers. During test pitting, soil samples will be collected from each approximate 2-foot depth interval. Each soil sample will be individually logged, and evidence of contamination will be noted. If changes in strata occur (e.g. a transition from sand to clay), the sample may be appropriately divided or additional samples may be collected and individually logged. To assist with the data evaluation, the field geologist will note the presence of materials that may affect laboratory soil sample results on the logs. These materials include:

- Presence or absence of mineral soils (i.e. pyrite or other likely arsenic bearing minerals as well as abundant micas)
- Presence or absence of asphalt
- Presence or absence of coal clinkers, coal ash or wood ash

Each collected soil sample will then be field screened for total VOCs using a photoionization detector (PID) in accordance with NHDES SOP HWRB-12. The PID will be calibrated with a 100 part per million by volume (ppm_v) isobutylene gas and a response factor of 1.0. Soil

samples collected for laboratory analysis of VOCs will be collected and preserved in accordance with NHDES SOP VOCs/Soil-2000.

Each soil sample will also be field screened for RCRA-8 metals with an Innov-X® Alpha 4000 portable X-ray fluorescence meter (XRF) in accordance with Maine DEP SOP DR#025. Because this is a screening level event to determine which, if any, metals are present in Site soil, samples will be screened directly in the collected polybags. Prior to XRF screening, sample bags will be kneaded to homogenize the soil.

Soil samples will be collected in accordance with NHDES SOP HWRB-11. Surficial soil samples from soil borings will be collected from the 0 to 2 foot below ground surface (bgs) interval. Surficial soil samples collected from hand dug locations will be collected from the 0 to 1 foot bgs interval. In each case, asphalt and base materials, landscaping materials, and other organic detritus will be removed prior to sampling.

Subsurface soil samples will be selected based on the sampling rationale discussed in **Section 6**. In general, subsurface soil samples will be selected based on the highest PID field screening result for VOCs, where visual or olfactory observations of contamination are observed, or from the depth of the water table interface if no other indicators of contamination are noted.

7.3 MONITORING WELL INSTALLATION AND SURVEY

7.3.1 Monitoring Well Installation and Development

As discussed in **Section 6**, selected soil borings will be completed as groundwater monitoring wells per EPA SOP EPASOP#2048. Unless Site conditions (e.g. shallow bedrock or confining layers) warrant modified well construction, each monitoring well will be installed using 2.0-inch PVC well materials including a well point or cap installed to span the water table, 10 feet of 0.010-inch slotted pipe, and solid pipe to grade. Washed No. 1 size silica sand will be placed around the slotted pipe to an elevation approximately two (2) feet above the slotted pipe to establish a well annulus. At least one (1) foot of bentonite chips will be placed on top of each well annulus to prevent stormwater infiltration into the wells. Each well will then be completed to grade with a flush mounted road box protected by a minimum of a 1-foot by 1-foot concrete pad. Each monitoring well will be developed by over pumping and agitation, and then allowed to equilibrate for at least two weeks prior to sampling.

7.3.2 Rod and Level Survey

Following installation, each monitoring well will be surveyed with a rod and level to determine the top of well and ground elevation at each location in accordance with ASTM E 1364-95. The monitoring wells will be tied to the existing monitoring well network at the Site and the west adjoining property.

7.4 GROUNDWATER SAMPLING

Prior to sampling, the depth to groundwater will be measured (and the presence of free floating product will be noted) in each groundwater monitoring well in accordance with NHDES SOP HWRB-1 to allow for the calculation of groundwater elevations and the determination of groundwater flow direction and gradients. Each monitoring well will then be sampled using low-flow sampling techniques and dedicated equipment in accordance with NHDES SOP HWRB-9. Each groundwater sample will be collected directly in laboratory glassware and will be submitted for off-site laboratory analysis.

7.5 SOIL GAS SAMPLING

NHDES's July 2006 Vapor Intrusion Guidance will be consulted for the installation of soil gas points and collection of representative soil gas samples. However, because this work is for evaluating sources of contaminants, not evaluating for vapor intrusion, we plan to deviate from the guidance and install points just beneath the concrete slab which is closer to the suspected source elevation. Probes will be situated 1 to 2 feet beneath the slab. Probes will be installed with a properly decontaminated hand held hammer drill. Once in place, probes will be sealed in place with modeling clay. To ensure that valid soil gas samples are collected as part of assessment, the use of a tracer compound may be used to assess for surface/annular seal leaks around the top of the soil gas probe. Before representative samples are collected between 1 and 5 purge volumes of soil gas will be removed from each probe. Samples will be evaluated in the field with a properly calibrated PID. Laboratory samples will be send to Columbia Analytical Laboratories for TO-15 Analysis for VOCs.

7.6 BUILDING MATERIAL DEBRIS SURVEYS

A NHDES certified asbestos inspector will be contracted to perform an asbestos survey of the debris pile at the Site. During the asbestos survey, samples will be collected from each suspect media (i.e. piping insulation, flooring, ceiling tiles) in accordance with NHDES Certified Administrative Rule ENV-1800: Asbestos Management Control. Asbestos samples will be submitted to a State approved laboratory for asbestos analysis by polarized light microscopy (PLM) by USEPA 600/R-93/116.

Based on the age of the building, there is the potential for lead-based paint and PCB building materials to have been used in the former building and may be present in the remaining debris pile. As a result, the building debris pile will be sampled for lead and PCBs using the laboratory analysis listed on **Table 2**.

8. REGULATORY STANDARDS

Sample results will be compared to the applicable state and/or federal standards/guidelines described below.

8.1 SOIL

Concentrations in soil samples will be compared to New Hampshire's Soil Remediation Standards (SRS) detailed in NHDES Env-Or 600 Contaminated Site Management. Where guidelines are not available, soil concentrations will be compared to other appropriate regulatory standards and guidelines, e.g., USEPA Regional Screening Levels (RSL) for Chemical Contaminants at Superfund Sites, RSL Table Updated April 2009 for soil. If standards or guidelines do not exist, action levels will be triggered if the sample analytical results exceed available published background levels. Please note that concentrations of total chromium identified at the Site will be compared to the SRS for hexavalent chromium as this elemental oxidation state is the applicable toxilogical driver.

8.2 GROUNDWATER

Groundwater sample results will be compared to the New Hampshire Ambient Groundwater Quality Standards (AGQS) detailed in NHDES Env-Or 600 Contaminated Site Management and USEPA Maximum Contaminant Levels (MCLs) for Drinking Water. In the event that no AGQS or MCLs exist for a particular contaminant, results will be compared to the USEPA Region 9 RSLs.

8.3 SOIL GAS

Soil gas sample results will not be compared to any NHDES or EPA standard because the results are being used to determine if a source or sources of VOCs are present beneath the slab. Moreover, no building currently exists at the Site or within 100 feet of the slab so data collected will only be used to determine the type of VOCs present and to locate borings and monitoring wells.

8.4 ACM

Asbestos sampling will be completed in accordance with NHDES Certified Administrative Rule ENV-1800: Asbestos Management Control. Levels of asbestos greater than or equal to 1% by volume as determined by weight, visual evaluation, and/or point count analysis within representative bulk samples obtained from the Site will result in the definition of such bulk materials as ACM.

8.5 LEAD-BASED PAINT

Concentrations of lead in paint as determined through the use of a XRF analyzer will be compared to a limit of 1.0 mg/cm^2 or 0.5% by weight. All construction work involving exposure or potential exposure to lead is covered by the Occupation Safety and Health Administration's Lead in Construction Standard 29 CFR 1926.62.

8.6 PCB BULK PRODUCTS

Building materials that have been analyzed to contain concentrations of total PCBs equal to or in excess of 50 ppm are defined as a PCB bulk product waste in accordance with 40 CFR 761.3. These materials are regulated for disposal under 40 CFR 761.62. Materials that have been analyzed to contain total PCBs at a concentration of equal to or greater than 1 ppm but less than 50 ppm are not regulated by the Toxic Substance Control Act (TSCA) for disposal as long as they remains in use. However, if this material is removed from use, such as through demolition, they must be disposed of at a facility that is licensed to accept this waste. Building materials which have been analyzed to contain total PCBs at a concentration of less than 1 ppm are unrestricted for future use and/or disposal.

9. PROPOSED PROJECT SCHEDULE

The following schedule is proposed for the Phase II ESA activities at the Site:

DATE	ACTION
Week of June 27, 2011	Finalize SSQAPP
Week of June 28, 2011	Implement Field Program
Week of July 7, 2011	Receive Laboratory Analytical Data
Week of July 30, 2011	Submit Draft Phase II ESA Report
Week of August 14, 2011	Submit Final Phase II ESA Report

View of tannery waste in soil from test pit CA-TP-14, located on northeastern portion of the Site.

APPENDIX C

TEST PIT LOGS

CREDERE ASSOCIATES, LLC
TEST PIT SAMPLING LOG
776 Main Street, Westbrook, Maine 04092 - 207-828-1272

TEST PIT DATA:

PROJECT NAME: Former Polyclad Laminates Site
DATE: 6/28/2011

PROJECT NUMBER: 10001086

SAMPLE LOCATION ID: **CA-TP-7**
ACTIVITY:
START: 1300
END: 1430

CREDERE REPRESENTATIVE: Jonathan O'Donnell

CONTRACTOR/FOREMAN: J.A. Eaton Inspections/Jeff Eaton

NOTES:

Test pit on western side of closed-in-place UST (presumed to be UST-6). Ductile iron pipe parallel and adjacent to UST prevented advancement of test pit beyond 8 feet below ground surface (bgs). No laboratory sample collected from this test pit.

FIELD ANALYSIS DATA:

DEPTH (FT)	SAMPLE DEPTH (FT)	SAMPLE NUMBER	MOISTURE	PID (ppm)	SOIL DESCRIPTION / NOTES
0	0-2	S-1	Slightly moist	0.0	Red-brown, medium to coarse SAND and Gravel. No volatile organic odor.
1					
2	No sample from 2 to 3 feet bgs.				
3	3-5	S-2	Slightly moist	0.0	
4					
5	5-7	S-3	Slightly moist	0.0	Side of UST observed.
6					
7	7-8	S-4	Slightly moist	0.0	Pipe adjacent to UST Side.
8	**End of Exploration at 8' bgs.**				

PID - Photo-Ionization Detector
ppm_v - parts per million by volume
* - Submitted for laboratory analysis

CREDERE ASSOCIATES, LLC
TEST PIT SAMPLING LOG
776 Main Street, Westbrook, Maine 04092 - 207-828-1272

TEST PIT DATA:

PROJECT NAME: Former Polyclad Laminates Site
DATE: 6/30/2011

PROJECT NUMBER: 10001086

SAMPLE LOCATION ID: **CA-TP-7A**
ACTIVITY:
START: 1535
END: 1720

CREDERE REPRESENTATIVE: Judd Newcomb

CONTRACTOR/FOREMAN: J.A. Eaton Inspections/Jeff Eaton; T & K Drilling/Sean McGarry

NOTES:

Test pit on southern side of closed-in-place UST (presumed to be UST-6) because test pit TP-7 was stopped due to a pipe near the UST western side. Test pit TP-7A advanced to 10 feet bgs using the excavator. Samples from 10 to 16 feet bgs collected by split-spoon sampler via a drill rig because the limit of the excavator's reach was approximately 10 feet.

FIELD ANALYSIS DATA:

DEPTH (FT)	SAMPLE DEPTH (FT)	SAMPLE NUMBER	MOISTURE	PID (ppm)	SOIL DESCRIPTION / NOTES
0					
1	4	S-1	Dry	0.5	Light-brown, fine to medium SAND and Gravel. No volatile organic odor.
2					
3					
4	6	S-2	Dry	1.4	Top of UST at 4 feet bgs. Observed 3" fill pipe (broken off during excavation) and UST full of sand. No volatile organic odor. Side of UST # 6 visible (4 to 10' bgs).
5					
6	8	S-3	Dry	1.3	
7					
8	9	S-4	Dry	1.4	
9	9.5	S-5	Dry	1.3	
10	10-12*	S-6	Dry	1.9	
11					
12	12-14	S-7	Dry	1.1	Medium dense, light-brown, fine to medium SAND and Gravel. No volatile organic odor.
13					
14	14-16	S-8	Dry	0.4	
15					
16					**End of Exploration at 16' bgs.**
	PID - Photo-Ionization Detector ppm_v - parts per million by volume * - Submitted for laboratory analysis

CREDERE ASSOCIATES, LLC
TEST PIT SAMPLING LOG
776 Main Street, Westbrook, Maine 04092 - 207-828-1272

TEST PIT DATA:

PROJECT NAME: Former Polyclad Laminates Site
DATE: 6/28/2011

PROJECT NUMBER: 10001086

SAMPLE LOCATION ID: **CA-TP-15**
ACTIVITY:
START: 1555
END: 1625

CREDERE REPRESENTATIVE: Jonathan O'Donnell

CONTRACTOR/FOREMAN: J.A. Eaton Inspections/Jeff Eaton

NOTES:
Test pit on southeastern portion of the Site to assess possible buried tannery waste.

FIELD ANALYSIS DATA:

DEPTH (FT)	SAMPLE DEPTH (FT)	SAMPLE NUMBER	MOISTURE	PID (ppm)	SOIL DESCRIPTION / NOTES
0	0-2	S-1	Dry	ND	Red-brown, medium to coarse SAND and Gravel. No volatile organic odor.
1					
2	2-4	S-2	Dry	ND	
3					
4	No sample from 4 to 5 feet bgs.				
5	5-7*	S-3	Dry	ND	Red-brown, medium to coarse SAND and Gravel. Appears native. No volatile organic odor.
6					
7	**End of Exploration at 7' bgs.**				

PID - Photo-Ionization Detector
ppm_v - parts per million by volume
* - Submitted for laboratory analysis

LABORATORY ANALYTICAL REPORTS

Absolute Resource associates
124 Heritage Avenue #10 Portsmouth, NH 03801

Jonathan O'Donnell
CREDERE Associates
776 Main Street
Westbrook, ME 04092

PO Number: None
Job ID: 21886
Date Received: 6/29/11

Project: POLYCLAD 10001086

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. The Standard Operating Procedures are based upon USEPA SW-846, USEPA Methods for Chemical Analysis of Water and Wastewater, Standard Methods for the Examination of Water and Wastewater and other recognized methodologies. The results contained in this report pertain only to the samples as indicated on the chain of custody.

Absolute Resource Associates maintains certification with the agencies listed below.

We appreciate the opportunity to provide laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be glad to assist you.

Sincerely,
Absolute Resource Associates

Sue Sylvester
Principal, General Manager

Quality Control Report

124 Heritage Avenue Unit 10
Portsmouth, NH 03801
www.absoluteresourceassociates.com

Case Narrative
Lab # 21886

Sample Receiving and Chain of Custody Discrepancies

Samples were received in acceptable condition, at 5 degrees C, on ice, and in accordance with sample handling, preservation and integrity guidelines.

Calibration

No exceptions noted.

Method Blank

No exceptions noted.

Surrogate Recoveries

PCB: The surrogates for 21886-013 were below the acceptance criteria. Matrix interference suspected.

Laboratory Control Sample Results

VOC: The MLCS/D4295 did not meet the acceptance criteria for chloromethane. This compound showed high recovery. There is no impact to the data as this analyte was not detected in the associated samples. The MLCS/D4295 did not meet the acceptance criteria for dichlorodifluoromethane. The MLCSD4295 did not meet the acceptance criteria for bromomethane. The recovery was acceptable in the LCS. These compounds are known to be problematic in the method.

Matrix Spike/Matrix Spike Duplicate/Duplicate Results

Not requested for this project.

Other

Reporting Limits: Dilutions performed during the analysis are noted on the result pages.

No other exceptions noted.

Report Date: 07/28/11

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Sample Receipt

The samples were received at the laboratory above the required temperature range. The samples were transported to the laboratory in a cooler with ice and delivered directly from the sampling site.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
C	- Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
D	- Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
E	- Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
G	- The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.
H	- The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
I	- The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
M	- Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
P	- The RPD between the results for the two columns exceeds the method-specified criteria.
Q	- The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised June 7, 2011 - Westboro Facility

The following list includes only those analytes/methods for which certification/approval is currently held.
For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0574. ***NELAP Accredited Solid Waste/Soil.***

Drinking Water (Inorganic Parameters: Color, pH, Turbidity, Conductivity, Alkalinity, Chloride, Free Residual Chlorine, Fluoride, Calcium Hardness, Sulfate, Nitrate, Nitrite, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Dissolved Solids, Total Organic Carbon, Total Cyanide, Perchlorate. Organic Parameters: Volatile Organics 524.2, Total Trihalomethanes 524.2, 1,2-Dibromo-3-chloropropane (DBCP), Ethylene Dibromide (EDB), 1,4-Dioxane (Mod 8270). Microbiology Parameters: Total Coliform-MF mEndo (SM9222B), Total Coliform – Colilert (SM9223 P/A), E. Coli. – Colilert (SM9223 P/A), HPC – Pour Plate (SM9215B), Fecal Coliform – MF m-FC (SM9222D))

Wastewater/Non-Potable Water (Inorganic Parameters: Color, pH, Conductivity, Acidity, Alkalinity, Chloride, Total Residual Chlorine, Fluoride, Total Hardness, Silica, Sulfate, Sulfide, Ammonia, Kjeldahl Nitrogen, Nitrate, Nitrite, O-Phosphate, Total Phosphorus, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Titanium, Vanadium, Zinc, Total Residue (Solids), Total Dissolved Solids, Total Suspended Solids (non-filterable), BOD, CBOD, COD, TOC, Total Cyanide, Phenolics, Foaming Agents (MBAS), Bromide, Oil and Grease. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, 2,4-D, 2,4,5-T, 2,4,5-TP(Silvex), Acid Extractables (Phenols), Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, Polynuclear Aromatic Hydrocarbons, Haloethers, Chlorinated Hydrocarbons, Volatile Organics, TPH (HEM/SGT), Extractable Petroleum Hydrocarbons (ETPH), MA-EPH, MA-VPH. Microbiology Parameters: Total Coliform – MF mEndo (SM9222B), Total Coliform – MTF (SM9221B), HPC – Pour Plate (SM9215B), Fecal Coliform – MF m-FC (SM9222D), Fecal Coliform – A-1 Broth (SM9221E).)

Solid Waste/Soil (Inorganic Parameters: pH, Sulfide, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Tin, Vanadium, Zinc, Total Cyanide, Ignitability, Phenolics, Corrosivity, TCLP Leach (1311), SPLP Leach (1312 metals only), Reactivity. Organic Parameters: PCBs, PCBs in Oil, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Extractable Petroleum Hydrocarbons (ETPH), MA-EPH, MA-VPH, Dicamba, 2,4-D, 2,4,5-T, 2,4,5-TP(Silvex), Volatile Organics, Acid Extractables (Phenols), 3.3'-Dichlorobenzidine, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Maine Department of Human Services Certificate/Lab ID: 2009024.
Drinking Water (Inorganic Parameters: SM9215B, 9222D, 9223B, EPA 180.1, 353.2, SM2130B, 2320B, 4500Cl-D, 4500CN-C, 4500CN-E, 4500F-C, 4500H+B, 4500NO3-F, EPA 200.7, EPA 200.8, 245.1, EPA 300.0. Organic Parameters: 504.1, 524.2.)

Wastewater/Non-Potable Water (Inorganic Parameters: EPA 120.1, 1664A, 350.1, 351.1, 353.2, 410.4, 420.1, SM2320B, 2510B, 2540C, 2540D, 426C, 4500Cl-D, 4500Cl-E, 4500CN-C, 4500CN-E, 4500F-B, 4500F-C, 4500H+B, 4500Norg-B, 4500Norg-C, 4500NH3-B, 4500NH3-G, 4500NH3-H, 4500NO3-F, 4500P-B, 4500P-E, 5210B, 5220D, 5310C, EPA 200.7, 200.8, 245.1. Organic Parameters: 608, 624, ME-DRO, ME-GRO, MA-EPH, MA-VPH.)

*Solid Waste/Soil (*Organic Parameters: ME-DRO, ME-GRO, MA-EPH, MA-VPH.)

Massachusetts Department of Environmental Protection Certificate/Lab ID: M-MA086.

Date Received: 7/1/11

Project: POLYCLAD 10001086

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. The Standard Operating Procedures are based upon USEPA SW-846, USEPA Methods for Chemical Analysis of Water and Wastewater, Standard Methods for the Examination of Water and Wastewater and other recognized methodologies. The results contained in this report pertain only to the samples as indicated on the chain of custody.

Absolute Resource Associates maintains certification with the agencies listed below.

We appreciate the opportunity to provide laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be glad to assist you.

Sincerely,
Absolute Resource Associates

Sue Sylvester
Principal, General Manager

Quality Control Report

124 Heritage Avenue Unit 10
Portsmouth, NH 03801
www.absoluteresourceassociates.com

Case Narrative
Lab # 21906

Sample Receiving and Chain of Custody Discrepancies

Samples were received in acceptable condition, at 1 degrees C, on ice, and in accordance with sample handling, preservation and integrity guidelines.

Calibration

No exceptions noted.

Method Blank

No exceptions noted.

Surrogate Recoveries

PCB: The surrogates were diluted out of the calibration range in the following sample due to interferences caused by the matrix: 21906-003, -004, -005, -006, and -008.

Laboratory Control Sample Results

PCB: The relative percent difference between the LCS4305 and LCSD4305 was outside the acceptance criteria for PCB-1016 and PCB-1260. The percent recovery for these analytes in each QC parameter was within the acceptance criteria. No impact to the data suspected.
VOC: The MLCS/D4307 did not meet the acceptance criteria for dichlorodifluoromethane and vinyl chloride. These compounds are known to be problematic in the method.

Matrix Spike/Matrix Spike Duplicate/Duplicate Results

Not requested for this project.

Other

Reporting Limits: Dilutions performed during the analysis are noted on the result pages.

No other exceptions noted.

Jonathan O'Donnell
CREDERE Associates
776 Main Street
Westbrook, ME 04092

PO Number: None
Job ID: 21917
Date Received: 7/6/11

Project: POLYCLAD 10001086

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. The Standard Operating Procedures are based upon USEPA SW-846, USEPA Methods for Chemical Analysis of Water and Wastewater, Standard Methods for the Examination of Water and Wastewater and other recognized methodologies. The results contained in this report pertain only to the samples as indicated on the chain of custody.

Absolute Resource Associates maintains certification with the agencies listed below.

We appreciate the opportunity to provide laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be glad to assist you.

Sincerely,
Absolute Resource Associates

Sue Sylvester
Principal, General Manager

Case Narrative
Lab # 21917

Sample Receiving and Chain of Custody Discrepancies

Samples were received in acceptable condition, at 3 degrees C, on ice, and in accordance with sample handling, preservation and integrity guidelines.

Calibration

No exceptions noted.

Method Blank

VOC: The compound, hexachlorobutadiene, was detected in the BLK1101353 at 0.5ug/L. There is no impact to the data as this analyte was not detected in the associated field samples.

Surrogate Recoveries

No exceptions noted.

Laboratory Control Sample Results

VOC: The LCS1101353 did not meet the acceptance criteria for dichlorodifluoromethane and dibromochloromethane. These compounds are known to be problematic in the method. The LCSD1101353 did not meet the acceptance criteria for bromomethane. This compound showed high recovery. There is no impact to the data as this analyte was not detected in the associated samples.
ABN: The LCS/D4327 did not meet the acceptance criteria for phenol and 4-nitrophenol. These compounds are known to be problematic in the method.

Matrix Spike/Matrix Spike Duplicate/Duplicate Results

Not requested for this project.

Other

ABN: The Base/Neutral portion of the sample extract for 21917-002 required a re-analysis at a dilution due to interferences caused by high concentrations of non-target compounds present in the sample chromatogram.

Reporting Limits: Dilutions performed during the analysis are noted on the result pages.

No other exceptions noted.

Attached please find results for the analysis of the samples received on the date referenced above.

Unless otherwise noted in the attached report, the analyses performed met the requirements of Absolute Resource Associates' Quality Assurance Plan. The Standard Operating Procedures are based upon USEPA SW-846, USEPA Methods for Chemical Analysis of Water and Wastewater, Standard Methods for the Examination of Water and Wastewater and other recognized methodologies. The results contained in this report pertain only to the samples as indicated on the chain of custody.

Absolute Resource Associates maintains certification with the agencies listed below.

We appreciate the opportunity to provide laboratory services. If you have any questions regarding the enclosed report, please contact the laboratory and we will be glad to assist you.

Sincerely,
Absolute Resource Associates

Cliff Chase
Partner, Technical Director

Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

For additional information, please contact Client Services at 800-624-9220.

Volatile Organics in Air

The canister certification results are provided as an addendum.

L1109811-04 The RPD of the pre- and post-flow controller calibration check (46% RPD) was outside acceptable limits (< or = 20% RPD).

L1109811-01 through -03 have elevated detection limits due to the dilution required by the elevated concentrations of target compounds in the samples.

L1109811-01 through -03 The presence of Propylene could not be determined in these samples due to non-target compounds interfering with the identification and quantification of this compound.

Project Name: POLYCLAD
Project Number: 10001087

Lab Number: L1109811
Report Date: 07/08/11

Case Narrative (continued)

The WG477447-3 LCS recoveries for Freon-114 (61%) and trans-1,3-Dichloropropene (68%) are outside the 70%-130% acceptance limit. The LCS was within overall method allowances, therefore the analysis proceeded.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

GLOSSARY

Acronyms

EPA	- Environmental Protection Agency.
LCS	- Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
LCSD	- Laboratory Control Sample Duplicate: Refer to LCS.
LFB	- Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.
MDL	- Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
MS	- Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.
MSD	- Matrix Spike Sample Duplicate: Refer to MS.
NA	- Not Applicable.
NC	- Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.
NI	- Not Ignitable.
RL	- Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.
RPD	- Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report.
SRM	- Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.

Footnotes

1	- The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

Terms

Analytical Method: Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

Data Qualifiers

A	- Spectra identified as "Aldol Condensation Product".
B	- The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than five times (5x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank.
C	- Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
D	- Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
E	- Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.
G	- The concentration may be biased high due to matrix interferences (i.e, co-elution) with non-target compound(s). The result should be considered estimated.
H	- The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
I	- The RPD between the results for the two columns exceeds the method-specified criteria; however, the lower value has been reported due to obvious interference.
M	- Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
P	- The RPD between the results for the two columns exceeds the method-specified criteria.
Q	- The quality control sample exceeds the associated acceptance criteria. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less

Report Format: Data Usability Report

Project Name:	POLYCLAD	**Lab Number:**	L1109811
Project Number:	10001087	**Report Date:**	07/08/11

Data Qualifiers

than 5x the RL. (Metals only.)

R - Analytical results are from sample re-analysis.

RE - Analytical results are from sample re-extraction.

J - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).

ND - Not detected at the reporting limit (RL) for the sample.

Report Format: Data Usability Report

LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

Certificate/Approval Program Summary

Last revised March 23, 2011 – Mansfield Facility

The following list includes only those analytes/methods for which certification/approval is currently held.
For a complete listing of analytes for the referenced methods, please contact your Alpha Customer Service Representative.

Connecticut Department of Public Health Certificate/Lab ID: PH-0141.

Wastewater/Non-Potable Water (Inorganic Parameters: pH, Turbidity, Conductivity, Alkalinity, Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Strontium, Thallium, Tin, Vanadium, Zinc, Total Residue (Solids), Total Suspended Solids (non-filterable), Total Cyanide. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Acid Extractables, Benzidines, Phthalate Esters, Nitrosamines, Nitroaromatics & Isophorone, PAHs, Haloethers, Chlorinated Hydrocarbons, Volatile Organics.)

Solid Waste/Soil (Inorganic Parameters: pH, Aluminum, Antimony, Arsenic, Barium, Beryllium, Cadmium, Calcium, Chromium, Hexavalent Chromium, Cobalt, Copper, Iron, Lead, Magnesium, Manganese, Mercury, Molybdenum, Nickel, Potassium, Selenium, Silver, Sodium, Thallium, Vanadium, Zinc, Total Organic Carbon, Total Cyanide, Corrosivity, TCLP 1311. Organic Parameters: PCBs, Organochlorine Pesticides, Technical Chlordane, Toxaphene, Volatile Organics, Acid Extractables, Benzidines, Phthalates, Nitrosamines, Nitroaromatics & Cyclic Ketones, PAHs, Haloethers, Chlorinated Hydrocarbons.)

Florida Department of Health Certificate/Lab ID: E87814. ***NELAP Accredited.***

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, SM2540G.)

Solid & Chemical Materials (Inorganic Parameters: 6020, 7470, 7471, 9045. Organic Parameters: EPA 8260, 8270, 8082, 8081.)

Air & Emissions (EPA TO-15.)

Louisiana Department of Environmental Quality Certificate/Lab ID: 03090. ***NELAP Accredited.***

Non-Potable Water (Inorganic Parameters: EPA 180.1, 245.7, 1631E, 3020, 6020A, 7470A, 9040, 9050A, SM2320B, 2540D, 2540G, 4500H-B, Organic Parameters: EPA 3510C, 3580A, 3630C, 3640A, 3660B, 3665A, 5030B, 8015D, 3570, 8081B, 8082A, 8260B, 8270C.)

Solid & Chemical Materials (Inorganic Parameters: EPA 1311, 3050, 3051A, 3060A, 6020A, 7196A, 7470A, 7471B, 7474, 9040B, 9045C, 9060. Organic Parameters: EPA 3540C, 3570B, 3580A, 3630C, 3640A, 3660, 3665A, 5035, 8015D, 8081B, 8082A, 8260B, 8270C.)

Biological Tissue (Inorganic Parameters: EPA 6020A. Organic Parameters: EPA 3570, 3510C, 3610B, 3630C, 3640A, 8270C.)

Air & Emissions (EPA TO-15.)

New Hampshire Department of Environmental Services Certificate/Lab ID: 2206. ***NELAP Accredited.***

Non-Potable Water (Inorganic Parameters: EPA, 245.1, 245.7, 1631E, 180.1, 6020A, 7470A, 9040B, 9050A, SM2540D, 2540G, 4500H+B, 2320B. Organic Parameters: EPA 8081, 8082, 8260B, 8270C.)

Biological Tissue (Inorganic Parameters: SW-846 6020 Organic Parameters: SW-846 8270C, 3510C, 3570, 3630C, 3640A)

New York Department of Health Certificate/Lab ID: 11627. ***NELAP Accredited.***

Non-Potable Water (Inorganic Parameters: SM2320B, SM2540D, EPA 200.8, 6020, 1631E, 245.1, 9014, 9040B, 120.1, SM2510B, 4500CN-E, 4500H-B, EPA 376.2, 180.1, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, 8082, 3510C, 5030B.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 6020, 7196A, 3060A, 7471A, 7474, 9014, 9040B, 9045C, 9010B. Organic Parameters: EPA 8260B, 8270C, 8081A, DRO 8015B, 8082, 1311, 1312, 3050B, 3580, 3570, 3051, 5035, 5030B.)

Air & Emissions (EPA TO-15.)

Rhode Island Department of Health Certificate/Lab ID: LAO00299. ***NELAP Accredited via LA-DEQ.***

Refer to LA-DEQ Certificate for Non-Potable Water.

Texas Commission of Environmental Quality Certificate/Lab ID: T104704419-08-TX. ***NELAP Accredited.***

Solid & Chemical Materials (Inorganic Parameters: EPA 6020, 7470, 7471, 1311, 7196, 9014, 9040, 9045, 9060. Organic Parameters: EPA 8015, 8270, 8260, 8081, 8082.)

Air (Organic Parameters: EPA TO-15)

Washington State Department of Ecology Certificate/Lab ID: C954. *Non-Potable Water* (Inorganic Parameters: SM2540D, 2510B, EPA 120.1, 180.1, 1631E, 245.7.)

Solid & Chemical Materials (Inorganic Parameters: EPA 9040, 9060, 6020, 7470, 7471, 7474. Organic Parameters: EPA 8081, 8082, 8015 Mod, 8270, 8260.)

U.S. Army Corps of Engineers

Department of Defense Certificate/Lab ID: L2217.01.

Non-Potable Water (Inorganic Parameters: EPA 6020A, SM4500H-B. Organic Parameters: 3020A, 3510C, 5030B, 8260B, 8270C, 8270C-ALK-PAH, 8082, 8081A, 8015D-SHC.)

Solid & Hazardous Waste (Inorganic Parameters: EPA 1311, 1312, 3050B, 6020A, 7471A, 9045C, 9060, SM 2540G, ASTM D422-63. Organic Parameters: EPA 3580A, 3570, 3540C, 5035A, 8260B, 8270C, 8270-ALK-PAH, 8082, 8081A, 8015D-SHC, 8015-DRO.

Air & Emissions (EPA TO-15.)

Analytes Not Accredited by NELAP
Certification is not available by NELAP for the following analytes: **8270C:** Biphenyl. **TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 2-Methylnaphthalene, 1-Methylnaphthalene.
